Chapter 1 Quick Start Guide

1

Package Contents

- Linksys Wireless Access Point
- Quick Start Guide
- Ethernet Cable
- AC Power Adapter
- CD with Documentation
- Mounting Bracket
- Mounting Kit
- Ceiling Mount Back Plate
- Drilling Layout Template

Physical Details

There is one LED for the device.

LED

LED Color	Activity	Status
	Blinking	System is booting.
Green	Solid	System is normal; no wireless device connected.
Blinking		Software upgrade in process.
Blue	Solid	System is normal; at least one wireless device connected.
	Blinking	Ethernet connection is not working.
Red	Solid	Booting process or update failed; hard reset or service re- quired.

Port and Button

Power Port - Connect the AC power adapter to this port.

NOTE: Use only the adapter that came with your access point.

Ethernet Port - Connect a wired network device to this port. This port supports PoE (Power over Ethernet) with a PoE switch or PoE injector. LAPN300 can be powered on from an 802.3af/802.3at compliance source, and LAPN600 is powered on from an 802.3at compliance source.

NOTE: If connected to a PoE switch or PoE injector, PoE will take precedence over an AC power adapter.

Reset Button - Press and hold this button for less than 15 seconds to power cycle device. Press and hold for longer than 15 seconds to reset the device to factory default settings.

Mounting Guide

To avoid overheating, do not install your access point if ambient temperatures exceed $104^{\circ}F$ (40°C). Install on a flat, stable surface, near the center of your wireless coverage area making sure not to block vents on the sides of the device enclosure.

Wall Installation

- 1. Position drilling layout template at the desired location.
- 2. Drill four screw holes on the mounting surface. If your Ethernet cable is routed behind the wall, mark Ethernet cable hole as well.
- 3. Secure the mounting bracket on the wall with anchors and screws.
- 4. If your Ethernet cable is routed behind the wall, cut or drill the Ethernet cable hole you marked in Step 2. Feed the Ethernet cable through the hole.
- 5. Connect the Ethernet cable and/or AC power adapter to your device.
- 6. Slide the device into the bracket. Turn clockwise until it locks into place.

Ceiling Installation

- 1. Select ceiling tile for mounting and remove tile.
- 2. Position drilling layout template at the desired location.
- 3. Drill four screw holes and Ethernet cable hole on the surface of ceiling tile..
- 4. Place back plate on the opposite side of ceiling tile. Secure mounting bracket to the ceiling tile with flathead screw and nut. Route the Ethernet cable through the Ethernet cable hole.

- 5. Replace tile in ceiling.
- 6. Connect the Ethernet cable and/or AC power adapter to your device
- 7. Slide the device into the bracket. Turn access point clockwise until it locks.

IMPORTANT

Improper or insecure mounting could result in damage to the device or personal injury. Linksys is not responsible for damages caused by improper mounting.

Chapter 2 Access Point Setup

Overview

This chapter describes the setup procedure to connect the wireless access point to your LAN, and configure it as an access point for your wireless stations.

Wireless stations may also require configuration. For details, see *Appendix C* - *Wireless Station Configuration*.

The wireless access point can be configured using a Web browser.

Setup using a Web Browser

Your browser must support JavaScript. The configuration program has been tested on the following browsers:

- Firefox 3.5 or later, Chrome 8 or later, Safari 5 or later
- Internet Explorer 7 or later

Setup Procedure

Before starting setup, install the wireless access point on your LAN, as described earlier.

1. Locate the wireless access point's default name on a label on the base or rear. The default name will be

lapxxxxx where

xxxxx is a set of the last 5 characters of your access point MAC Address. MAC Address is available in the brown box label or product label.

2. Use a PC connected to your LAN, either by a wired connection or another access point. Until the wireless access point is configured, establishing a wireless connection to it may be not possible.

If your LAN contains a router or routers, ensure the PC used for configuration is on the same LAN segment as the wireless access point.

- 3. Start your Web browser.
- Enter the IP address of the wireless access point, as in this example, which uses the wireless access point's default IP address: http://192.168.1.252

At the login prompt, enter **admin** for the *User name*, and **admin** for the *Password*. These are the default values. You should change the password.

AUTHENTICATION REQUIRED
Username:
Password:
Log in

Figure 1: Password Dialog

- 5. From the *status* screen menu configure for your environment. Details of these screens and settings are described in the following sections of this chapter.
- 6. You may also wish to change the admin password on the *User Accounts* screen, accessed from the **Configuration** menu.
- 7. Wireless stations must now be set to match the wireless access point. See Chapter 4 for details.

If you can't connect:

It is likely that your PC's IP address is incompatible with the wireless access point's IP address. This can happen if your LAN does not have a DHCP Server. The default IP address of the wireless access point is 192.168.1.252, with a network mask of 255.255.255.0.

If your PC's IP address is not compatible with this, you must change your PC's IP address to an unused value in the range 192.168.1.1 ~ 192.168.1.254, with a network mask of 255.255.255.0. See *Appendix A - Windows TCP/IP* for details for this procedure.

Setup Wizard

The first time you connect to the wireless access point, run the *Setup Wizard* to configure the device.

1. Click the *Quick Start* link on the main menu

Figure 2: Setup Wizard

- 2. On the first screen, click Launch.
- 3. Set the password on the *Device Password* screen, if desired.
- 4. Configure the time zone, date and time for the device on System Settings screen.

	Setur	o Wizard					
Device Password	Enter Device Name And System Time						
System Settings	Set a meaningful name for this box, and configure time.						
IPv4 Address	Host Name:	lap964fd					
Wireless Network	Current Clock:	2013/12/09 Mon 22:29:05 (-08:00)

Figure 12: Management Access Screen

Web Access		
НТТР	HTTP (Hyper Text Transfer Protocol) is the standard for transferring files (text, graphic images and other multimedia files) on the World Wide Web.Enable to allow Web access by HTTP protocol.	
	Endote to allow web access by III II protocol.	
HTTP Port	Specify the port for HTTP. It can be 80 (default) or from 1024 to 65535.	
HTTP to HTTPS Redirect	Enable to redirect Web access of HTTP to HTTPS automatically. This field is available only when HTTP access is disabled.	
	This field is available only when fift fit access is disabled.	
HTTPS	HTTPS (Hypertext Transfer Protocol Secure) can provide more secure communication with the SSL/TLS protocol, which support data encryption to HTTP clients and servers.	
	Enable to allow Web access by HTTPS protocol.	
HTTPS Port	Specify the port for HTTPS. It can be 443 (default) or from 1024 to 65535.	

From Wireless	Enable wireless devices to connect to access point's admin page. Disabled by default.		
Access Control	By default, no IP addresses are prohibited from accessing the device's admin page. You can enable access control and enter specified IP addresses for access. Four IPv4 and four IPv6 addresses can be specified.		
SNMP Settings			
SNMP	Simple Network Management Protocol (SNMP) is a network monitoring and management protocol.		
	Enable or disable SNMP function here. Disabled by default.		
Contact	Enter contact information for the access point.		
	The contact includes 1 to 32 characters. Special characters are allowed.		
Location	Enter the area or location where the access point resides.		
	The location includes 1 to 32 characters. Special characters are allowed.		
SNMP v1/v2 Settings			
Get Community	Enter the name of Get Community. Get Community is used to read data from the access point and not for writing data into the access point.		
	Get Community includes 1 to 32 characters. Special characters are allowed.		
Set Community	Enter the name of Set Community. Set Community is used to write data into the access point.		
	The Set Community includes 1 to 32 characters. Special characters are allowed.		
SNMP v3 Settings			
SNMP v3 Settings	Configure the SNMPv3 settings if you want to use SNMPv3.		
	• Username: Enter the username. It includes 0 to 32 characters. Special characters are allowed.		
	• Authentication Protocol: None or HMAC-MD5.		
	• Authentication Key: 8 to 32 characters. Special characters are allowed.		
	• Privacy Protocol: None or CBC-DES.		
	• Privacy Key: 8 to 32 characters. Special characters are allowed.		
Access Control			
Access Control	When SNMP is enabled, any IP address can connect to the access point's admin page through SNMP. You can enable access control to allow specified IP addresses. Two IPv4 and two IPv6 addresses can be specified.		
SNMP Trap			

Trap Community	Enter the Trap Community server. It includes 1 to 32 characters. Special characters are allowed.	
Trap Destination	Two Trap Community servers are supported: can be IPv4 or IPv6.

TCP/IP	
Host Name	Assign a host name to this access point. Host name consists of 1 to 15 characters. Valid characters include A-Z, a-z, 0-9 and Character cannot be first and last character of hostname and hostname cannot be composed of all digits.
VLAN	Enables or disables VLAN function.
Untagged VLAN	Enables or disables VLAN tagging. If enabled (default), traffic from the LAN port is untagged when the following conditions are met: 1) VLAN ID is equal to Untagged VLAN ID and 2) untagged traffic can be accepted by LAN port. If disabled, traffic from the LAN port is always tagged and only tagged traffic can be accepted from LAN port. By default all traffic on the access point uses VLAN 1, the default untagged VLAN. All traffic will be untagged until you disable the untagged VLAN, change the untagged traffic VLAN ID, or change the VLAN ID for a SSID.

Untagged VLAN ID	Specifies a number between 1 and 4094 for the untagged VLAN ID. The default is 1. Traffic on the VLAN that you specify in this field is not be tagged with a VLAN ID when forwarded to the network. Untagged VLAN ID field is active only when untagged VLAN is enabled. VLAN 1 is the default for both untagged VLAN and management VLAN.		
Management VLAN	The VLAN associated with the IP address you use to connect to the access point. Provide a number between 1 and 4094 for the Management VLAN ID. The default is 1.		
IPv4/v6			
IP Settings	Select Automatic Configuration or Static IP Address.		
IP Address	Enter an unused IP address from the address range used on your LAN.		
Subnet Mask	Enter the subnet mask for the IP address above.		
Default Gateway	Enter the gateway for the IP address above.		
Primary DNS	Enter the DNS address.		
Secondary DNS	Optional. If entered, this DNS will be used if the Primary DNS does not respond.

Auto Negotiation	If enabled, Port Speed and Duplex Mode will become grey and cannot be configured. If disabled, Port Speed and Duplex Mode can be configured.
Operational Auto Negotiation	Current Auto Negotiation mode of the Ethernet port.
Port Speed	Select the speed of the Ethernet port. Available only when Auto Negotiation is disabled. The option can be 10M, 100M or 1000M (default).
Operational Port Speed	Displays the current port speed of the Ethernet port.
Duplex Mode	Select the duplex mode of the Ethernet port. Available only when Auto Negotiation is disabled. The option can be Half or Full (default).
Operational Duplex Mode	Displays the current duplex mode of the Ethernet port.

	Enable or disable flow control of the Ethernat part			
Flow Control	Enable or disable flow control of the Ethernet port.			
802.1x Supplicar	nt			
802.1x Supplicant	Enable if your network requires this access point to use 802.1X authentication in order to operate.			
Authentication	This feature supports following two kinds of authentication:			
	Authentication via MAC Address Select this if you want to use MAC Address for authentica- tion. The access point uses lowercase MAC address for Name and Password, like xxxxxxxxxx.			
	Authentication via Name and Password			
	Select this if you want to use name and password for authentication.			
	Name - Enter the login name. The name includes 1 to 63 characters. Special characters are allowed.			
	Password - Enter the desired login password. The password includes 4 to 63 characters. Special characters are allowed.			
Discovery Settin	gs			
Bonjour	Enable if administrator wants the access point to be discovered by Bonjour enabled devices automatically. If VLAN is enabled, the discovery packets will be sent out via management VLAN only. The access point supports http and https services.			
LLDP	Enable if administrator wants the access point to be discovered by switch by LLDP protocol. Information such as product name, device name, firmware version, IP address, MAC address and so on will be advertised.			
LLDP-MED	Enable if administrator wants the access point to be discovered by switch by LLDP-MED protocol. Information such as product name, device name, firmware version, IP address, MAC address and so on will be advertised.			

Wireless Screens

There are ten configuration screens:

- Basic Settings
- Security
- Rogue AP Detection
- Scheduler
- Scheduler Association
- Connection Control
- Rate Limit
- QoS
- Workgroup Bridge
- Advanced Settings

Basic Settings

Basic Settings provides the essential configuration for your wireless radio and SSIDs. You should able to set up your wireless network with these essential parameters configured. For advanced wireless settings such as Band Steering, Channel Bandwidth etc., they will be on Configuration \rightarrow Wireless \rightarrow Advanced Settings screen.

Click *Basic Settings* on the Wireless menu.

Figure 16: Basic Settings Screen

Data - Wireless Basic Settings Screen

Basic Wireless Settings				
Wireless Radio	Select the wireless radio from the list.			
	Radio 1 is for 2.4 GHz, and Radio 2 is for 5 GHz.			
Enable Radio	Enable or disable the wireless radio.			
Wireless Mode	Select the desired option for radio 1:			
	• G only - allow connection by 802.11G wireless stations only.			
	• N only - allow connection by 802.11N wireless stations only.			
	• B/G-Mixed - allow connection by 802.11B and G wireless stations only.			
	• B/G/N-Mixed (Default) - allow connections by 802.11N, 802.11B and 802.11G wireless stations.			
	Select the desired option for radio 2:			
	• A only - allow connection by 802.11A wireless stations only.			
	• N only - allow connection by 802.11N wireless stations only.			
	• A/N-Mixed - allow connection by 802.11A and N wireless stations only.			
Wireless Channel	Select wireless channel of the radio.			
	If Auto is selected, the access point will select the best available channel when device boots up.			
	If you experience lost connections and/or slow data transfers, experiment with manually setting different channels to see which is the best.			
SSID Settings	·			
SSID Name	Enter the desired SSID Name. Each SSID must have a unique name. The name includes 1 to 32 characters			
Broadcast	Enable or disable the broadcast of the SSID.			
	When the access point does not broadcast its SSID, the network name is not shown in the list of available networks on a client station. In- stead, you must enter the exact network name manually into the wireless connection utility on the client so that it can connect.			
Isolation	Enable or disable isolation among clients of the SSID. If enabled, wireless clients cannot communicate with others in the same SSID.			
	It's disabled by default.			
VLAN ID	Enter the VLAN ID of the SSID.			
	Used to tag packets which are received from the wireless clients of the SSID and sent from Ethernet or Workgroup Bridge interfaces.			
	Applicable only when VLAN function is enabled. VLAN function can be configured in Configuration -> LAN -> Network Setup screen.			
Max Clients	Enter the number of clients that can connect to the SSID. The range is from 0 to 32, and 0 means no limit.			

Security Settings

Use this screen to configure security settings of SSIDs to provide data protection over the wireless network

Figure 17: Security Settings

Data - SSID Settings Screen

Security	
Select SSID	Select the desired SSID from the drop-down list.
Security Mode	Select the desired security method from the list.

Security Settings

- **Disabled** No security. Anyone using the correct SSID can connect to your network.
- WEP The 802.11b standard. Data is encrypted before transmission, but the encryption system is not very strong.
- WPA2-Personal This is a further development of WPA-PSK, and offers even greater security, using the AES (Advanced Encryption Standard) method. This method, sometimes called "Mixed Mode", allows clients to use either WPA-Personal (with TKIP) or WPA2-Personal (with AES).
- WPA2-Enterprise Requires a RADIUS Server on your LAN to provide the client authentication according to the 802.1x standard. Data transmissions are encrypted using the WPA2 standard.

If this option is selected:

• This access point must have a client login on the RADIUS Server.

- Each user must authenticate on the RADIUS Server. This is usually done using digital certificates.
- Each user's wireless client must support 802.1x and provide the RADIUS authentication data when required.
- All data transmission is encrypted using the WPA2 standard. Keys are automatically generated, so no key input is required.
- **RADIUS** RADIUS mode utilizes RADIUS server for authentication and dynamic WEP key generation for data encryption.

Security Settings - WEP

This is the 802.11b standard. Data is encrypted before transmission, but the encryption system is not very strong.

Downstream Rate	Enter a maximum downstream for the SSID. The range is from 0 to 200 Mbps; 0 means no limitation.

QoS

The QoS (Quality of Service) feature allows you to specify priorities for different traffic coming from your wireless client. Lower priority traffic will be slowed down to allow greater throughput or less delay for high priority traffic.

Figure 29: QoS Screen

Data -	QoS	Screen
--------	-----	--------

QoS Setting	
Wireless Radio	Select the desired radio from the list.
	Radio 1 is for 2.4 GHz, and Radio 2 is for 5 GHz.
QoS Settings	
SSID	The index of SSID.
SSID Name	The name of the SSID.
VLAN ID	The VLAN ID of the SSID.
Priority	Select the priority level from the list.
	The 802.1p will be included in the VLAN header of the packets which are received from the SSID and sent from Ethernet or Workgroup Bridge interface.

WMM	Enable or disable WMM.
	WMM (Wi-Fi Multimedia) is a component of the IEEE 802.11e wireless LAN standard for QoS.
	WMM provides prioritization of wireless data packets from different applications based on four access categories: voice, video, best effort, and background. For an application to receive the benefits of WMM QoS, both it and the client running that application have to have WMM enabled. Legacy applications that do not support WMM and applica- tions that do not require QoS, are assigned to the best effort category, which receives a lower priority than voice and video.
	WMM is enabled by default.

Workgroup Bridge

Workgroup Bridge feature enables the access point to extend the accessibility of a remote network. In Workgroup Bridge mode, the access point acts as a wireless station (STA) on the wireless LAN. It can bridge traffic between a remote wired network and a wireless LAN.

When Workgroup Bridge is enabled, SSID configuration still works to provide wireless services to clients.

All access points participating in Workgroup Bridge must have the identical settings for Radio interface, IEEE 802.11 mode, Channel Bandwidth, Channel (Auto is not recommended).

Figure 31: Advanced Settings

Data - Advanced Settings Screen

Country/Region	
Country/Region	Select your country or region from the drop-down list. This field displays the region of operation for which the wireless interface is intended. It may not be legal to operate the access point in a country/region not shown here. If your country or region is not listed, please check with your local government agency or Linksys's website for more information on which channels to use.
	Note: The country code function is for non-US model only and all US-models does not have this function.

Band Steering	
Band Steering	Enable or disable Band Steering function.
	Band Steering is a technology that detects whether the wireless client is dual-band capable. If it is, band steering pushes the client to connect to the less-congested 5 GHz network. It does this by actively blocking the client's attempts to connect with the 2.4GHz network.
Isolation	
Isolation between SSIDs	Define whether to isolate traffic between SSIDs. If enabled, wireless clients in different SSIDs cannot communicate with each other. Enabled by default.
Advanced Parameters	
Wireless Radio	Select the desired radio from the list.
	Radio 1 is for 2.4 GHz, and Radio 2 is for 5 GHz.
Worldwide Mode (802.11d)	Worldwide Mode (802.11d) enables the access point to direct connected wireless devices to radio settings specific to where the world the devices are in use.
Channel Bandwidth	You can select the channel bandwidth manually for Wireless-I connections. When it is set to 20MHz, only 20MHz channel is being used. When it is set to 40MHz, Wireless-N connections will use 40MHz channel, but Wireless-B connections and Wireless-G connections will still use 20MHz channel.
Guard Interval	Select the guard interval manually for Wireless-N connections The two options are Short (400 nanoseconds) and Long (800 nanoseconds). The default is Auto.
CTS Protection Mode	CTS (Clear-To-Send) Protection Mode boosts the access point ability to catch all Wireless-G transmissions, but it severely decreases performance. By default, CTS Protection Mode is disabled, but the access point will automatically enable this feature when Wireless-G devices are not able to transmit to the access point in an environment with heavy 802.11b traffic.
Beacon Interval	The access point transmits beacon frames at regular intervals to announce the existence of the wireless network. Enter the interval between the transmissions of beacon frames. The valu range is between 40 and 1000 milliseconds and default is 100 milliseconds.

DTIM Interval	Enter the Delivery Traffic Information Map (DTIM) period, an integer from 1 to 255 beacons. The default is 1 beacon.
	The DTIM message is an element included in some beacon frames. It indicates which client stations, currently sleeping in low-power mode, have data buffered on the access point await- ing pickup.
	The DTIM period that you specify indicates how often the clients served by this WAP device should check for buffered data still on the access point awaiting pickup.
	For example, if you enter 1, clients check for buffered data on the access point at every beacon. If you enter 10, clients check on every 10th beacon.
RTS Threshold	Enter the Request to Send (RTS) Threshold value, an integer from 1 to 2347. The default is 2347 octets.
	The RTS threshold indicates the number of octets in a Medium Access Control Protocol Data Unit (MPDU) below which an RTS/CTS handshake is not performed.
	Changing the RTS threshold can help control traffic flow through the access point, especially one with a lot of clients. If you specify a low threshold value, RTS packets are sent more frequently, which consumes more bandwidth and reduces the throughput of the packet. However, sending more RTS packets can help the network recover from interference or collisions that might occur on a busy network, or on a network experiencing electromagnetic interference.
Fragmentation Threshold	Enter the fragmentation threshold, an integer from 256 to 2346. The default is 2346.
	The fragmentation threshold is a way of limiting the size of packets (frames) transmitted over the network. If a packet exceeds the fragmentation threshold you set, the fragmentation function is activated and the packet is sent as multiple 802.11 frames.
	If the packet being transmitted is equal to or less than the threshold, fragmentation is not used. Setting the threshold to the largest value (2,346 bytes, which is the default) effectively disables fragmentation.
	Fragmentation involves more overhead because of the extra work of dividing up and reassembling of frames it requires, and because it increases message traffic on the network. However, fragmentation can help improve network performance and reliability if properly configured.
Output Power	Select the output power of the access point. If many access points exist, lower power can reduce the signal interference among them.

Chapter 3 Operation and Status

Operation

You may need to perform the following operations on a regular basis.

- If using the *Access Control* feature, update the *Trusted PC* database as required. (See *Access Control* in Chapter 2 for details.)
- If using 802.1x mode, update the *User Login* data on the Windows 2000 Server, and configure the client PCs, as required.

System Summary

Provides system status of the access point.

LAN Status displays settings, and status of LAN interface.

Figure 33: LAN Status Screen

Data - L	.AN	Status
----------	-----	--------

VLAN	
VLAN	Enabled or disabled (default).
Untagged VLAN	Enabled (default) or disabled.
	When enabled, and if its VLAN ID is equal to Untagged VLAN ID, all traffic is untagged when sent from LAN ports. Untagged traffic can be accepted by LAN ports. If disabled, traffic is always tagged when sent from LAN port and only tagged traffic can be accept from LAN port.
	By default all traffic on the access point uses VLAN 1, the default untagged VLAN. This means that all traffic is untagged until you disable the untagged VLAN, change the untagged traffic VLAN ID, or change the VLAN ID for a SSID.
Untagged VLAN ID	Displays the untagged VLAN ID. Traffic on the VLAN that you specify in this field is not be tagged with a VLAN ID when forwarded to the network. VLAN 1 is the default ID for untagged VLAN and management VLAN.

Management VLAN	Displays the Management VLAN ID. The VLAN associated with the IP address you use to connect to the access point. Provide a number between 1 and 4094 for the Management VLAN ID. The default is 1.
	This VLAN is also the default untagged VLAN. If you already have a management VLAN configured on your network with a different VLAN ID, you must change the VLAN ID of the man- agement VLAN on the access point.
IPv4/v6	
IP Address	The IP address of the wireless access point.
Subnet Mask	The Network Mask (Subnet Mask) for the IP address above.
Default Gateway	Enter the gateway for the LAN segment to which the wireless access point is attached (the same value as the PCs on that LAN segment).
Primary DNS	The primary DNS address provided by the DHCP server or configured manually.
Secondary DNS	The secondary DNS address provided by the DHCP server or configured manually.

Chapter 4

Access point Management

Overview

This chapter covers features available on the wireless access point's Maintenance menu.

- Maintenance
 - Firmware Upgrade
 - Configuration Backup/Restore
 - Factory Default
 - Reboot
- Diagnostics
 - Ping Test
 - Packet Capture
 - Diagnostic Log

Firmware Upgrade

The firmware (software) in the wireless access point can be upgraded by using HTTP/HTTPS, or TFTP.

Check Linksys support website (<u>http://www.linksys.com/business/support</u>) and download the latest firmware release to your storage such as PC. Then, perform firmware upgrade by following the steps below.

During firmware upgrade, do not power off device or disconnect Ethernet cable. Device will reboot automatically after firmware upgrade is completed.

LINKSYS	LAPN600 Wireless	s-N600 Dual Band Access Po	oint with PoE	Log out Help Firmware Version: V1.0.06.000

	Source File: TFTP Server: Upgrade			
	© 2013	Belkin International, Inc. and/or its subsidi	iaries and affiliates, including L	inksys, LLC. All rights reserved.

Figure 38: Firmware Upgrade Screen

To perform the firmware upgrade from local PC:

- 1. Click the *Browse* button and navigate to the location of the upgrade file.
- 2. Select the upgrade file. Its name will appear in the Upgrade File field.
- 3. Click the *Upgrade* button to commence the firmware upgrade.

To perform the firmware upgrade from TFTP server:

- 1. Enter the IP address of the TFTP server and the source file. The source file is the firmware filename you stored in your TFTP server. Only support IPv4 address here.
- 2. Click the *Upgrade* button to commence the firmware upgrade.

Configuration

Configuration backup/restore allows you to download the configuration file from device to external storage, e.g., your PC, or network storage, or to upload a previously saved configuration file from external storage to device. It is highly recommended you save one extra copy of the configuration file to external storage after you are done with access point setup.

Figure 39: Configuration Backup/Restore Screen

Backup/Restore to/fr	om Local PC		
Backup Configuration	Once you have the access point working properly, you should back up the settings to a file on your computer. You can later restore the access point's settings from this file, if necessary.		
	To create a backup file of the current settings:		
	• Click Backup .		
	• If you don't have your browser set up to save downloaded files automatically, locate where you want to save the file, rename it if you like, and click Save .		
Restore	To restore settings from a backup file:		
Configuration	1. Click Browse .		
	2. Locate and select the previously saved backup file.		
	3. Click Restore		

Backup/Restore to/f	rom TFTP server
Backup Configuration	 To create a backup file of the current settings: Enter the destination file name you plan to save in TFTP server. Enter the IP address for the TFTP server. Only support IPv4 address here. Click Backup
Restore Configuration	 To restore settings from a backup file: 1. Enter the source file name stored in TFTP server. 2. Enter the IP address for the TFTP server. Only support IPv4 address here. 3. Click Restore

Factory Default

It's highly recommended you save your current configuration file before you restore to factory default settings. To save your current configuration file, click Maintenance \rightarrow Configuration Backup/Restore.

Appendix A Troubleshooting

Overview

This chapter covers some common problems encountered while using the wireless access point, and some possible solutions to them. If you follow the suggested steps and the wireless access point still does not function properly, contact your dealer for further advice.

General Problems

Problem 1: I can't find new access point on my network.

Solution 1: Check the following.

- The wireless access point is properly installed, LAN connections are OK, and it is powered ON. Check the LEDs for system and port status.
- Ensure that your PC and the wireless access point are on the same network segment. (If you don't have a router, this must be the case.)
- You can use the following method to determine the IP address of the wireless access point, and then try to connect using the IP address, instead of the name.

To Find the access point's IP Address

- 1. Open a MS-DOS Prompt or Command Prompt Window.
- 2. Use the Ping command to ping the wireless access point. Enter ping followed by the default name of the wireless access point. Default name is a string with "lap" and the last 5 characters of device MAC address. e.g.
 - ping lap600040
- 3. Check the output of the ping command to determine the IP address of the wireless access point, as shown below.

PDdosnt 🛛	
Microsoft Windows 2000 [Version 5.00.2195] (C) Copyright 1985-2000 Microsoft Corp.

Reply from 192.168.1.252:bytes=32 Reply from 192.168.1.252:bytes=32	time<10ms TTL=64
Reply from 192.168.1.252:bytes=32 Reply from 192.168.1.252:bytes=32	time<10ms TTL=64 time<10ms TTL=64

Figure 45: Ping

If your PC uses a Fixed (Static) IP address, ensure that it is using an IP Address that is in the network segment (subnet) with the wireless access point. On Windows PCs, you can use *Control Panel->Network* to check the *Properties* for the TCP/IP protocol.

If there is no DHCP Server found, the wireless access point will roll back to an IP address and mask of 192.168.1.252 and 255.255.25.0.

Problem 2: My PC can't connect to the LAN via the wireless access point.

- **Solution 2:** Check the following:
 - The SSID and security settings on the PC match the settings on the wireless access point.
 - On the PC, the wireless mode is set to "Infrastructure"
 - If using the *Access Control* feature, the PC's name and address is in the *Trusted Stations* list.
 - If using 802.1x mode, ensure the PC's 802.1x software is configured correctly. See Chapter 4 for details of setup for the Windows XP 802.1x client. If using a different client, refer to the vendor's documentation.

Appendix B About Wireless LANs

Overview

Wireless networks have their own terms and jargon. It is necessary to understand many of these terms in order to configure and operate a wireless LAN.

Wireless LAN Terminology

Modes

Wireless LANs can work in either of two (2) modes:

- Ad-hoc
- Infrastructure

Ad-hoc Mode

Ad-hoc mode does not require an access point or a wired (Ethernet) LAN. Wireless stations, e.g., notebook PCs with wireless cards communicate directly with each other.

Infrastructure Mode

In Infrastructure Mode, one or more access points are used to connect wireless stations, e.g., notebook PCs with wireless cards to a wired (Ethernet) LAN. The wireless stations can then access all LAN resources.

Access points can only function in "Infrastructure" mode, and can communicate only with wireless stations that are set to "Infrastructure" mode.

SSID/ESSID

BSS/SSID

A group of wireless stations and a single access point, all using the same ID (SSID), form a Basic Service Set (BSS).

Using the same SSID is essential. Devices with different SSIDs are unable to communicate with each other.

ESS/ESSID

A group of wireless stations, and multiple access points, all using the same ID (ESSID), form an Extended Service Set (ESS).

Different access points within an ESS can use different channels. To reduce interference, it is recommended that adjacent access points SHOULD use different channels.

As wireless stations are physically moved through the area covered by an ESS, they will automatically change to the access point that has the least interference or best performance. This capability is called **Roaming**. (Access points do not have or require roaming capabilities.)

Channels

The wireless channel sets the radio frequency used for communication.

Access points use a fixed channel. You can select the channel used. This allows you to choose a channel that provides the least interference and best performance. For USA and Canada, the following channels are available. 2.4GHz:

2.412 to 2.462 GHz; 11 channels

5GHz:

- 5.180 to 5.320 GHz; 8 channels
- 5.500 to 5.700 GHz, 8 channels (excludes 5.600 to 5.640 GHz)
- 5.745 to 5.825 GHz; 5 channels
- If using multiple access points it is better if adjacent access points use different channels to reduce interference. The recommended channel spacing between adjacent access points is five channels, e.g., use Channels 1 and 6, or 6 and 11.
- In "Infrastructure" mode wireless stations normally scan all channels looking for an access point. If more than one access point can be used, the one with the strongest signal is used. (This can only happen within an ESS.)
- If using "Ad-hoc" mode (no access point) all wireless stations should be set to use the same channel. However, most wireless stations will still scan all channels to see if there is an existing "Ad-hoc" group they can join.

WEP

WEP (Wired Equivalent Privacy) is a standard for encrypting data before it is transmitted. This is desirable because it is impossible to prevent snoopers from receiving any data which is transmitted by your wireless stations. If the data is encrypted, it is meaningless unless the receiver can decrypt it.

If WEP is used, the wireless stations and the wireless access point must have the same settings.

WPA-PSK

In WPA-PSK, like WEP, data is encrypted before transmission. WPA is more secure than WEP. The PSK (Pre-shared Key) must be entered on each wireless station. The 256-bit encryption key is derived from the PSK, and changes frequently.

WPA2-PSK

This is a further development of WPA-PSK, and offers even greater security, using the AES (Advanced Encryption Standard) method of encryption. It should be used if possible.

WPA-Enterprise

This version of WPA requires a RADIUS server on your LAN to provide the client authentication according to the 802.1X standard. Data transmissions are encrypted using the WPA standard.

If this option is used:

- The access point must have a "client login" on the RADIUS server.
- Each user must have a "user login" on the RADIUS server.
- Each user's wireless client must support 802.1X and provide the login data when required.

All data transmission is encrypted using the WPA standard. Keys are automatically generated, so no key input is required.

WPA2-Enterprise

This version of WPA2 requires a RADIUS server on your LAN to provide the client authentication according to the 802.1X standard. Data transmissions are encrypted using the WPA2 standard.

If this option is used:

- The access point must have a "client login" on the RADIUS server.
- Each user must have a "user login" on the RADIUS server.
- Each user's wireless client must support 802.1X and provide the login data when required.

All data transmission is encrypted using the WPA2 standard. Keys are automatically generated, so no key input is required.

802.1x

This uses the 802.1X standard for client authentication, and WEP for data encryption. If possible, you should use WPA-Enterprise instead, because WPA encryption is much stronger than WEP encryption.

If this option is used:

- The access point must have a "client login" on the RADIUS server.
- Each user must have a "user login" on the RADIUS server.
- Each user's wireless client must support 802.1X and provide the login data when required.
- All data transmission is encrypted using the WEP standard. You only have to select the WEP key size; the WEP key is automatically generated.

Appendix C PC and Server Configuration

Overview

All wireless stations need to have settings that match the wireless access point. These settings depend on the mode in which the access point is being used.

- If using WEP or WPA2-PSK, it is only necessary to ensure that each wireless station's settings match those of the wireless access point, as described below.
- For 802.1x modes, configuration is much more complex. The RADIUS server must be configured correctly, and setup of each wireless station is also more complex.

Using WEP

For each of the following items, each wireless station must have the same settings as the wireless access point.

Mode	On each PC, the mode must be set to <i>Infrastructure</i> .					
SSID (ESSID)	This must match the value used on the wireless access point.					
	The default value is LinksysSMB24G for radio 1 and LinksysSMB5G for radio 2.					
	Note: The SSID is case sensitive.					
Wireless Security	 Each wireless station must be set to use WEP data encryption. The key size (64 bit, 128 bit) must be set to match the access point. The key values on the PC must match the key values on the access point. 					
Note: On some systems, the key sizes may be shown as 40-bit and 10						
	instead of 64-bit, 128-bit. This is because the key input by the user is 24 bits less than the key size used for encryption.					

Using WPA2-PSK

For each of the following items, each wireless station must have the same settings as the wireless access point.

Mode	On each PC, the mode must be set to <i>Infrastructure</i> .					
SSID (ESSID)	This must match the value used on the wireless access point.					
	The default value is LinksysSMB24G for radio 1 and LinksysSMB5G for radio 2.					
	Note The SSID is case sensitive.					
Wireless Security	 On each client, wireless security must be set to WPA2-PSK. The Pre-shared Key entered on the access point must also be entered on each wireless client. The Encryption method (e.g. TKIP, AES) must be set to match the 					
	access point.					

Using WPA2-Enterprise

This is the most secure and most complex system.

WPA-Enterprise mode provides greater security and centralized management, but it is more complex to configure.

Wireless Station Configuration

For each of the following items, each wireless station must have the same settings as the wireless access point.

Mode	On each PC, the mode must be set to <i>Infrastructure</i> .
SSID (ESSID)	This must match the value used on the wireless access point.
	The default value is LinksysSMB24G for radio 1 and LinksysSMB5G for radio 2.
	Note The SSID is case sensitive.
802.1x Authentication	Each client must obtain a certificate for authentication for the RADIUS server.
802.1x Encryption	Typically, EAP-TLS is used. This is a dynamic key system, so keys do NOT have to be entered on each wireless station.
	You can also use a static WEP key (EAP-MD5). The wireless access point supports both methods simultaneously.

RADIUS Server Configuration

If using **WPA2-Enterprise** mode, the RADIUS server on your network must be configured as follows.

- It must provide and accept **Certificates** for user authentication.
- There must be a **Client Login** for the wireless access point itself.

The wireless access point will use its default name as its client login name. (However, your RADIUS server may ignore this and use the IP address instead.)

The *Shared Key*, set on the *Security* Screen of the access point, must match the *Shared Secret* value on the RADIUS server.

• Encryption settings must be correct.

802.1x Server Setup (Windows 2000 Server)

This section describes using *Microsoft Internet Authentication Server* as the RADIUS server, since it is the most common RADIUS server available that supports the EAP-TLS authentication method.

The following services on the Windows 2000 Domain Controller (PDC) are also required.

- dhcpd
- dns
- rras
- webserver (IIS)
- RADIUS Server (Internet Authentication Service)
- Certificate Authority

Windows 2000 Domain Controller Setup

- 1. Run *dcpromo.exe* from the command prompt.
- 2. Follow all of the default prompts, ensure that DNS is installed and enabled during installation.

Services Installation

- 1. Select the Control Panel -> Add/Remove Programs.
- 2. Click Add/Remove Windows Components from the left side.
- 3. Ensure that the following components are selected.

Certificate Services. After enabling this, you will see a warning that the computer cannot be renamed and joined after installing certificate services. Select *Yes* to select certificate services and continue

World Wide Web Server. Select *World Wide Web Server* on the *Internet Information Services* (IIS) component.

From the *Networking Services* category, select *Dynamic Host Configuration Protocol* (DHCP), and *Internet Authentication Service* (DNS should already be selected and installed).

Windows Components Wizard	×

802.1x Client Setup on Windows XP

Windows XP ships with a complete 802.1x client implementation. If using Windows 2000, you can install SP3 (Service Pack 3) to gain the same functionality.

If you don't have either of these systems, you must use the 802.1x client software provided with your wireless adapter. Refer to your vendor's documentation for setup instructions.

The following instructions assume that:

- You are using Windows XP
- You are connecting to a Windows 2000 server for authentication.
- You already have a login (User-name and password) on the Windows 2000 server.

Client Certificate Setup

- 1. Connect to a network that doesn't require port authentication.
- 2. Start your Web browser. In the *Address* box, enter the IP address of the Windows 2000 Server, followed by */certsrv*

```
e.g http://192.168.0.2/certsrv
```

3. You will be prompted for a user name and password. Enter the *User name* and *Password* assigned to you by your network administrator, and click *OK*.

8. You will receive a confirmation message. Click Yes.

Figure 67: Root Certificate Screen

9. Certificate setup is now complete.

802.1x Authentication Setup

- 1. Open the properties for the wireless connection, by selecting *Start Control Panel Network Connections*.
- 2. Right-click on the Wireless Network Connection, and select Properties.
- 3. Select the *Authentication* Tab, and ensure that *Enable network access control using IEEE* 802.1X is selected, and *Smart Card or other Certificate* is selected from the EAP type.

Encryption Settings

The encryption settings must match the access point's on the wireless network you wish to join.

 Windows XP will detect any available wireless networks, and allow you to configure each network independently. • Your network administrator can advise you of the correct settings for each network. 802.1x networks typically use EAP-TLS. This is a dynamic key system, so there is no need to enter key values.

Enabling Encryption

To enable encryption for a wireless network, follow this procedure.

1. Click on the Wireless Networks tab.

🕹 Wirel	- Wireless Network Connection Properties 🛛 🕐 🔀					
General	Wireless Networks	Authentication	Advanced			
Availa	Windows to configur					
i.	onnect to an available misslairA rtest		Configue			
Autor belov	Preferred networks: Automatically connect to available networks in the order listed below:					
	misslairA		Move do			
	Add Remo	ve Prope	rties			
	about <u>setting up wire</u> juration.	less network	Advar	nced		
		0	к <u>с</u>	Cancel		

Figure 69: Wireless Networks Screen

- 2. Select the wireless network from the Available Networks list, and click Configure.
- 3. Select and enter the correct values, as advised by your Network Administrator. For example, to use EAP-TLS, you would enable *Data encryption*, and click the checkbox for the setting *The key is provided for me automatically*, as shown below.

Wireless Network Properties 🛛 ?					
Network name (SSID):	misslairA				
Wireless network key (WE	P)				
This network requires a key for the following:					
Data encryption (WEP enabled)					
Network Authentication (Shared mode)					
Network key:					
Key format:	ASCII characters				
Key length:	104 bits (13 characters) 💌				
Key index (advanced):	0				
The key is provided for me automatically					
This is a computer-to-com access points are not use					
	OK Cancel				

Figure 70: Properties Screen

Setup for Windows XP and 802.1x client is now complete.

Using 802.1x Mode (without WPA)

This is very similar to using WPA-Enterprise.

The only difference is that on your client, you must NOT enable the setting *The key is pro-vided for me automatically*.

Instead, you must enter the WEP key manually, ensuring it matches the WEP key used on the access point.

Wireless Network Properties 🛛 🛛 🔀					
Network name (SSID):	misslairA				
Wireless network key (WEP)					
This network requires a k	ey for the following:				
Data encryption (WEP enabled)					
Network Authentication (Shared mode)					
Network key:					
Key format:	ASCII characters				
Key length	104 bits (13 characters) 👻				
Key index (advanced):					
The key is provided for	or me automatically				
This is a computer-to-co access points are not us	omputer (ad hoc) network; wireless sed				
	OK Cancel				

Figure 71: Properties Screen

Note:

On some systems, the 64-bit WEP key is shown as 40-bit and the 128-bit WEP key is shown as 104-bit. This difference arises because the key input by the user is 24 bits less than the key size used for encryption.

Regulatory Approvals

Federal Communication Commission Interference Statement

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that

to which the receiver is connected.

• Consult the dealer or an experienced radio/TV technician for help.

FCC Caution: Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment.

This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

Operations in the 5.15-5.25GHz band are restricted to indoor usage only.

Radiation Exposure Statement

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

Note: The country code selection is for non-US model only and is not available to all US model. Per FCC regulation, all WiFi product marketed in US must fixed to US operation channels only.

Industry Canada statement

This device complies with RSS-210 of the Industry Canada Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Ce dispositif est conforme à la norme CNR-210 d'Industrie Canada applicable aux appareils radio exempts de licence. Son fonctionnement est sujet aux deux conditions suivantes: (1) le dispositif ne doit pas produire de brouillage préjudiciable, et (2) ce dispositif doit accepter tout brouillage reçu, y compris un brouillage susceptible de provoquer un fonctionnement indésirable.

Caution

(i) the device for operation in the band 5150-5250 MHz is only for indoor use to reduce the potential for harmful interference to co-channel mobile satellite systems;

(ii) high-power radars are allocated as primary users (i.e. priority users) of the bands 5250-5350 MHz and 5650-5850 MHz and that these radars could cause interference and/or damage to LE-LAN devices.

Avertissement

les dispositifs fonctionnant dans la bande 5 150-5 250 MHz sont réservés uniquement pour une utilisation à l'intérieur afin de réduire les risques de brouillage préjudiciable aux systèmes de satellites mobiles utilisant les mêmes canaux;

(ii) De plus, les utilisateurs devraient aussi être avisés que les utilisateurs de radars de haute puissance sont désignés utilisateurs principaux (c.-à-d., qu'ils ont la priorité) pour les bandes 5 250-5 350 MHz et 5 650-5 850 MHz et que ces radars pourraient causer du brouillage et/ou des dommages aux dispositifs LAN-EL.

Radiation Exposure Statement

This equipment complies with IC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

Déclaration d'exposition aux radiations

Cet équipement est conforme aux limites d'exposition aux rayonnements IC établies pour un environnement non contrôlé. Cet équipement doit être installé et utilisé avec un minimum de 20 cm de distance entre la source de rayonnement et votre corps.
