Copyright Statement

THIS DOCUMENT CONTAINS OF PROPRIETARY TECHNICAL INFORMATION THAT IS THE PROPERTY OF THIS COMPANY. AND NO PART OF THIS DOCUMENTATION MAY BE REPRODUCED, STORED IN A RETRIEVAL SYSTEM OR TRANSMITTED IN ANY FORM OR BY ANY MEANS, ELECTRICAL OR MECHANICAL, BY PHOTOCOPYING, RECORDING, OR OTHERWISE, WITHOUT THE PRIOR WRITTEN CONSENT OF THIS COMPANY.

Federal Communication Commission Interference Statement

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Caution :

Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions:

- (1) This device may not cause harmful interference.
- (2) This device must accept any interference received, including interference that may cause undesired operation.

FCC RF Radiation Exposure Statement :

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. End users must follow the specific operating instructions for satisfying RF exposure compliance. This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter. This equipment has been SAR-evaluated for use in hand. SAR measurements are based on a 5mm spacing from the body and that compliance is achieved at that distance. Hereby, IOGEAR Technologies, Inc. declares that this WLAN 11n Router, 2T2R is in compliance with the essential requirements and other relevant provisions of Directive 1999/5/EC.

1 Introduction

The Wireless LAN Broadband Router is an affordable IEEE 802.11b/g/n wireless LAN broadband router solution; setting SOHO and enterprise standard for high performance, secure, manageable and reliable WLAN.

This document describes the steps required for the initial IP address assign and other WLAN router configuration. The description includes the implementation of the above steps.

1.1 Package contents

The package of the WLAN Broadband Router includes the following items,

- ✓ The WLAN Broadband Router
- ✓ The AC to DC power adapter
- ✓ The Documentation CD
- ✓ RJ-45 Cable Line (Option)

1.2 Product Specifications

Model Name	GWU637
Product Name	Travel Router 11n 2T2R
Standard	802.11b/g/n, 802.3, 802.3u
Data Transfer Rate	1,2,5.5,6,9,11,12,18,24,36,48,54,60,90,120 and maximum of 300Mbps
Modulation Method	BPSK/QPSK/16-QAM/64-QAM
Frequency Band	2.4GHz ISM Band
RF Output Power	< 13dBm@11n,< 17dBm@11b,< 15dBm@11g
Receiver Sensitivity	11b: -80dBm@8%, 11g: -70dBm@10%,11n: -64dBm@10%
Operation Range	Indoor up to 100 meters, Outdoor up to 180 meters
Antenna	Internal Antenna
LED	ETHERNET, WLAN, WPS/Reset
Security	WEP, WPA, WPA2
Ethernet interface	One 10/100 BaseT with RJ45 port(WAN/LAN)
Power	5V/1A through MicroUSB
Operating Temperature	0 - 50° C ambient temperature
Storage Temperature	-10 ~ 70° C ambient temperature
Humidity	5 to 90 % maximum (non-condensing)
Dimension	65(L) * 24(W) * 18(H) mm

1.3 Product Features

Generic Router

- Provides wireless speed up to 300Mbps data rate
- Supports WEB based management and configuration.
- Supports UPnP, IGMP Snooping & Proxy.
- Supports Dynamic DNS, NTP client service.
- Supports Log table and remote Log service.
- Supports Setup Wizard mode.
- Supports Wireless schedule.
- Compatible with IEEE 802.11b/11g/11n Specifications.
- Supports multiple AP, provides maximum 5 groups of SSID.
- Supports Denial-of-Service.
- Supports IEEE 802.3x full duplex flow control on 10/100M Ethernet interface.
- Supports bridging, routing and WISP functions between wireless and wired Ethernet interfaces.
- Supports IEEE 802.1x, 64-bit and 128-bit WEP, WPA, WPA2 encryption/decryption and WPA with Radius.
- Supports DHCP server to provide clients auto IP addresses assignment and static DHCP functions.
- Supports DHCP client, static IP, PPPoE, PPTP, L2TP of WAN Interface.
- Supports firewall security with port filtering, IP filtering, MAC filtering, port forwarding, URL Filtering and DMZ hosting functions.
- Supports AP mode, Client mode, WDS, AP+WDS and Universal Repeater.
- Supports QoS which controls the bandwidth by IP or MAC address.
- Supports WPS (Wi-Fi Protected Setup).
- Supports WAPI (Wireless Authentication Privacy Infrastructure).
- Supports Green Ethernet, IEEE802.3az draft2.0, EEE (Energy Efficient Ethernet).

Panel Description

LED Indicator	State	Description
1. WLAN LED	Flashing	Data is transmitting or receiving on the antenna.
	Off	No data is transmitting or receiving on the antenna.
2. WPS / Reset LED	Flashing	The WPS feature is Enabled.
	Off	The WPS feature is Disabled.
3. WPS Button		Push continually the reset button 5 ~ 10 seconds to enable the WPS feature.
4. Ethernet LED ACT	Flashing	Data is transmitting or receiving on the LAN interface.
	On	Port linked.
	Off	No link.

Interface Description

Interfaces	Description
Power	<p>The power jack allows an external DC power supply connection.</p> <p>The external AC to DC adaptor provide adaptive power requirement to the WLAN Broadband Router.</p>
Reset	<p>Push continually the reset button 5 ~ 10 seconds to reset the configuration parameters to factory defaults.</p>

2 Installation

2.1 Hardware Installation

Step 1: Place the Wireless LAN Broadband Router to the best optimum transmission location. The best transmission location for your WLAN Broadband Router is usually at the geographic center of your wireless network, with line of sight to all of your mobile stations.

Step 2: Connect the WLAN Broadband Router to your wired network. Connect the Ethernet WAN interface of WLAN Broadband Router by category 5 Ethernet cable to your switch/ hub/ xDSL modem or cable modem. A straight-through Ethernet cable with appropriate cable length is needed.

Step 3: Supply DC power to the WLAN Broadband Router. Use only the AC/DC power adapter supplied with the WLAN Broadband Router; it may occur damage by using a different type of power adapter.

The hardware installation finished.

2.2 Software Installation

- There are no software drivers, patches or utilities installation needed, but only the configuration setting. Please refer to chapter 3 for software configuration.

Notice: It will take about 50 seconds to complete the boot up sequence after powered on the WLAN Broadband Router; Power LED will be active, and after that the WLAN Activity LED will be flashing to show the WLAN interface is enabled and working now.

3 Software configuration

There are web based management and configuration functions allowing you to have the jobs done easily.

The WLAN Broadband Router is delivered with the following factory default parameters on the Ethernet LAN interfaces.

Default IP Address: **192.168.1.254**

Default IP subnet mask: **255.255.255.0**

WEB login User Name: **<empty>**

WEB login Password: <empty>

3.1 Prepare your PC to configure the WLAN Broadband Router

For OS of Microsoft Windows 7/8/8.1:

1. Click the *Start* button and select *Settings*, then click *Control Panel*. The *Control Panel* window will appear.
Note: Windows Me users may not see the Network control panel. If so, select **View all Control Panel options** on the left side of the window
2. Move mouse and double-click the right button on *Network* icon. The *Network* window will appear.
3. Check the installed list of *Network Components*. If TCP/IP is not installed, click the *Add* button to install it; otherwise go to step 6.
4. Select *Protocol* in the *Network Component Type* dialog box and click *Add* button.
5. Select *TCP/IP* in *Microsoft* of *Select Network Protocol* dialog box then click OK button to install the TCP/IP protocol, it may need the Microsoft Windows CD to complete the installation. Close and go back to *Network* dialog box after the TCP/IP installation.
6. Select *TCP/IP* and click the *properties* button on the *Network* dialog box.
7. Select *Specify an IP address* and type in values as following example.
 - ✓ IP Address: **192.168.1.1**, any IP address within 192.168.1.1 to 192.168.1.253 is good to connect the Wireless LAN Access Point.
 - ✓ IP Subnet Mask: **255.255.255.0**
8. Click OK and reboot your PC after completes the IP parameters setting.

For OS of Microsoft Windows 2000, XP:

1. Click the *Start* button and select *Settings*, then click *Control Panel*. The *Control Panel* window will appear.
2. Move mouse and double-click the right button on *Network and Dial-up Connections* icon. Move mouse and double-click the *Local Area Connection* icon. The *Local Area Connection* window will appear. Click *Properties* button in the *Local Area Connection* window.
3. Check the installed list of *Network Components*. If TCP/IP is not installed, click the *Add* button to install it; otherwise go to step 6.
4. Select *Protocol* in the *Network Component Type* dialog box and click *Add* button.
5. Select *TCP/IP* in *Microsoft* of *Select Network Protocol* dialog box then click OK button to install the TCP/IP protocol, it may need the Microsoft Windows CD to complete the installation. Close and go back to *Network* dialog box after the TCP/IP

installation.

6. Select *TCP/IP* and click the *properties* button on the *Network* dialog box.
7. Select *Specify an IP address* and type in values as following example.
 - ✓ IP Address: **192.168.1.1**, any IP address within 192.168.1.1 to 192.168.1.253 is good to connect the Wireless LAN Access Point.
 - ✓ IP Subnet Mask: **255.255.255.0**
8. Click OK to completes the IP parameters setting.

For OS of Microsoft Windows NT:

1. Click the *Start* button and select *Settings*, then click *Control Panel*. The *Control Panel* window will appear.
2. Move mouse and double-click the right button on *Network* icon. The *Network* window will appear. Click *Protocol* tab from the *Network* window.
3. Check the installed list of *Network Protocol* window. If TCP/IP is not installed, click the *Add* button to install it; otherwise go to step 6.
4. Select *Protocol* in the *Network Component Type* dialog box and click *Add* button.
5. Select *TCP/IP* in *Microsoft* of *Select Network Protocol* dialog box then click OK button to install the TCP/IP protocol, it may need the Microsoft Windows CD to complete the installation. Close and go back to *Network* dialog box after the TCP/IP installation.
6. Select *TCP/IP* and click the *properties* button on the *Network* dialog box.
7. Select *Specify an IP address* and type in values as following example.
 - ✓ IP Address: **192.168.1.1**, any IP address within 192.168.1.1 to 192.168.1.253 is good to connect the Wireless LAN Access Point.
 - ✓ IP Subnet Mask: **255.255.255.0**
8. Click OK to complete the IP parameters setting.

For OS of Microsoft Windows Vista:

1. Click the *Start* button and select *Settings*, then click *Control Panel*. The *Control Panel* window will appear.
 2. Move mouse and double-click the right button on *Network Connections* item. The *Network Connections* window will appear. Double click *Local Area Connection* icon, then *User Account Control* window shown. Right click *Continue* button to set properties.
 3. In *Local Area Connection Properties* window, Choose *Networking* tab, move mouse and click *Internet Protocol Version 4 (TCP/IPv4)*, then click *Properties* button.
 4. Move mouse and click *General* tab, Select *Specify an IP address* and type in values as following example.
-

- ✓ IP Address: **192.168.1.1**, any IP address within 192.168.1.1 to 192.168.1.253 is good to connect the Wireless LAN Access Point.
 - ✓ IP Subnet Mask: **255.255.255.0**
5. Click OK to complete the IP parameters setting.

3.2 Connect to the WLAN Broadband Router

Open a WEB browser, i.e. Microsoft Internet Explore 6.1 SP1 or above, then enter 192.168.1.254 on the URL to connect the WLAN Broadband Router.

3.3 Management and configuration on the WLAN Broadband Router

3.3.1 Status

This page shows the current status and some basic settings of the device, includes system, wireless, Ethernet LAN and WAN configuration information.

Access Point Status	
This page shows the current status and some basic settings of the device.	
System	
Uptime	0day:0h:38m:32s
Firmware Version	SGW2x2-N01-3464.00
Build Time	Thu Jan 29 14:07:08 CST 2015
Wireless Configuration	
Mode	AP
Band	2.4 GHz (B+G+N)
SSID	MyWLAN
Channel Number	11
Encryption	Disabled
BSSID	5c:f3:70:1d:07:39
Associated Clients	1
TCP/IP Configuration	
Attain IP Protocol	Fixed IP
IP Address	192.168.1.254
Subnet Mask	255.255.255.0
Default Gateway	192.168.1.254
DHCP Server	Enabled
MAC Address	5c:f3:70:1d:07:39
WAN Configuration	
Attain IP Protocol	Getting IP from DHCP server...
IP Address	0.0.0.0

Default Gateway	0.0.0.0
MAC Address	5c:f3:70:1d:07:3a

Screen snapshot – Status

Item	Description
System	
Uptime	It shows the duration since WLAN Broadband Router is powered on.
Firmware version	It shows the firmware version of WLAN Broadband Router.
Build time	It shows the Build-up time of firmware
Wireless configuration	
Mode	It shows wireless operation mode
Band	It shows the current wireless operating frequency.
SSID	It shows the SSID of this WLAN Broadband Router. The SSID is the unique name of WLAN Broadband Router and shared among its service area, so all devices attempts to join the same wireless network can identify it.
Channel Number	It shows the wireless channel connected currently.
Encryption	It shows the status of encryption function.
BSSID	It shows the BSSID address of the WLAN Broadband Router. BSSID is a six-byte address.
Associated Clients	It shows the number of connected clients (or stations, PCs).
TCP/IP configuration	
Attain IP Protocol	It shows type of connection.
IP Address	It shows the IP address of LAN interfaces of WLAN Broadband Router.
Subnet Mask	It shows the IP subnet mask of LAN interfaces of WLAN Broadband Router.
Default Gateway	It shows the default gateway setting for LAN interfaces outgoing data packets.
DHCP Server	It shows the DHCP server is enabled or not.
MAC Address	It shows the MAC address of LAN interfaces of WLAN Broadband Router.
WAN configuration	
Attain IP Protocol	It shows how the WLAN Broadband Router gets the IP address. The IP address can be set manually to a fixed one or set dynamically by DHCP server or attain IP by

	PPPoE / PPTP connection.
IP Address	It shows the IP address of WAN interface of WLAN Broadband Router.
Subnet Mask	It shows the IP subnet mask of WAN interface of WLAN Broadband Router.
Default Gateway	It shows the default gateway setting for WAN interface outgoing data packets.
MAC Address	It shows the MAC address of WAN interface of WLAN Broadband Router.

3.3.2 Setup Wizard

This page guides you to configure wireless broadband router for first time

Screen snapshot – Setup Wizard

I Time Zone Setting

This page is used to enable and configure NTP client

Screen snapshot – Time Zone Settings

II LAN Interface Setup

This page is used to configure local area network IP address and subnet mask

Screen snapshot – LAN Interface Setup

III WAN Interface Setup

This page is used to configure WAN access type

Screen snapshot – WAN Interface Setup

IV Wireless Basic Settings

This page is used to configure basic wireless parameters like Band, Mode, Network Type SSID, Channel Number, Enable Mac Clone(Single Ethernet Client)

Screen snapshot – Wireless Basic Settings

V Wireless Security Setup

This page is used to configure wireless security

6. Wireless Security Setup

This page allows you setup the wireless security. Turn on WEP or WPA by using Encryption Keys could prevent any unauthorized access to your wireless network.

Encryption: WEP

Key Length: 64-bit

Key Format: Hex (10 characters)

Key Setting:

Screen snapshot – Wireless Security Setup

3.3.3 Wireless - Basic Settings

This page is used to configure the parameters for wireless LAN clients that may connect to your Broadband Router. Here you may change wireless encryption settings as well as wireless network parameters.

Wireless Basic Settings

This page is used to configure the parameters for wireless LAN clients which may connect to your Access Point. Here you may change wireless encryption settings as well as wireless network parameters.

Disable Wireless LAN Interface

Band:

Mode:

Network Type:

SSID:

Channel Width:

Control Sideband:

Channel Number:

Broadcast SSID:

WMM:

Data Rate:

Associated Clients:

Enable Mac Clone (Single Ethernet Client)

Enable Universal Repeater Mode (Acting as AP and client simultaneously)

SSID of Extended Interface:

Screen snapshot – Wireless Basic Settings

Item	Description
Disable Wireless LAN Interface	Click on to disable the wireless LAN data transmission.
Band	Click to select 2.4GHz(B) / 2.4GHz(G) / 2.4GHz(N) 2.4GHz(B+G)/ 2.4GHz(G+N) / 2.4GHz(B+G+N)
Mode	Click to select the WLAN AP / Client / WDS / AP+WDS wireless mode.
Network Type	While Mode is selected to be Client . Click to select the network type infrastructure or Ad hoc.
SSID	It is the wireless network name. The SSID can be 32

	bytes long.
Channel Width	Select the operating channel width 20 MHz or 40 MHz. [N band only]
Control Sideband	Select the Sideband with Upper or Lower for channel width 40MHz. [N band only]
Channel Number	Select the wireless communication channel from pull-down menu.
Broadcast SSID	Click to enable or disable the SSID broadcast function. Refer to 4.14 What is SSID Broadcast?
WMM	Click Enabled/Disabled to init WMM feature.
Data Rate	Select the transmission data rate from pull-down menu. Data rate can be auto-select, 1M to 54Mbps or MCS. Refer to 4.32 What is Modulation Coding Schemes (MCS)?
Associated Clients	Click the Show Active Clients button to open Active Wireless Client Table that shows the MAC address, transmit-packet, receive-packet and transmission-rate for each associated wireless client.
Enable Mac Clone (Single Ethernet Client)	Take Laptop NIC MAC address as wireless client MAC address. [Client Mode only]
Enable Universal Repeater Mode	Click to enable Universal Repeater Mode
SSID of Extended Interface	Assign SSID when enables Universal Repeater Mode.
Apply Changes	Click the Apply Changes button to complete the new configuration setting.
Reset	Click the Reset button to abort change and recover the previous configuration setting.

3.3.4 Wireless - Advanced Settings

These settings are only for more technically advanced users who have a sufficient knowledge about wireless LAN. These settings should not be changed unless you know what effect the changes will have on your WLAN Broadband Router.

Wireless Advanced Settings

These settings are only for more technically advanced users who have a sufficient knowledge about wireless LAN. These settings should not be changed unless you know what effect the changes will have on your Access Point.

Fragment Threshold: (256-2346)

RTS Threshold: (0-2347)

Beacon Interval: (20-1024 ms)

Preamble Type: Long Preamble Short Preamble

IAPP: Enabled Disabled

Protection: Enabled Disabled

Aggregation: Enabled Disabled

Short GI: Enabled Disabled

WLAN Partition: Enabled Disabled

RF Output Power: 100% 70% 50% 35% 15%

Screen snapshot – Wireless Advanced Settings

Item	Description
Fragment Threshold	Set the data packet fragmentation threshold, value can be written between 256 and 2346 bytes. Refer to 4.10 What is Fragment Threshold?
RTS Threshold	Set the RTS Threshold, value can be written between 0 and 2347 bytes. Refer to 4.11 What is RTS(Request To Send) Threshold?
Beacon Interval	Set the Beacon Interval, value can be written between 20 and 1024 ms. Refer to 4.12 What is Beacon Interval?
Preamble Type	Click to select the <i>Long Preamble</i> or <i>Short Preamble</i>

	support on the wireless data packet transmission. Refer to 4.13 What is Preamble Type?
IAPP	Click to enable or disable the IAPP function. Refer to 4.20 What is Inter-Access Point Protocol(IAPP)?
Protection	Protect 802.11n user priority.
Aggregation	Click to enable or disable the Aggregation function. Refer to 4.33 What is Aggregation?
Short GI	Click to enable or disable the short Guard Intervals function. Refer to 4.34 What is Guard Intervals (GI)?
WLAN Partition	Click to enable or disable that prevents associated wireless clients from communication with each other.
RF Output Power	To adjust transmission power level.
Apply Changes	Click the Apply Changes button to complete the new configuration setting.
Reset	Click the Reset button to abort change and recover the previous configuration setting.

3.3.5 Wireless - Security Setup

This page allows you setup the wireless security. Turn on WEP, WPA, WPA2 by using encryption keys could prevent any unauthorized access to your wireless network.

Screen snapshot – Wireless Security Setup

Item	Description
Select SSID	Select the SSID from multiple APs.
Encryption	Select the encryption supported over wireless access. The encryption method can be None, WEP, WPA, WPA2 or WPA-Mixed Refer to 4.9 What is WEP? 4.15 What is Wi-Fi Protected Access (WPA)? 4.16 What is WPA2?
Use 802.1x Authentication	While Encryption is selected to be WEP. Click the check box to enable IEEE 802.1x authentication function. Refer to 4.17 What is 802.1x Authentication?
Authentication Type	Click to select the authentication type in <i>Open System</i> , <i>Shared Key</i> or <i>Auto</i> selection.

Key Length	Select the WEP shared secret key length from pull-down menu. The length can be chose between 64-bit and 128-bit (known as “WEP2”) keys. The WEP key is composed of initialization vector (24 bits) and secret key (40-bit or 104-bit).
Key Format	Select the WEP shared secret key format from pull-down menu. The format can be chose between plant text (ASCII) and hexadecimal (HEX) code.
Encryption Key	Secret key of WEP security encryption function.
WPA Authentication Mode	While Encryption is selected to be WPA. Click to select the WPA Authentication Mode with Enterprise (RADIUS) or Personal (Pre-Shared Key). Refer to 4.15 What is Wi-Fi Protected Access (WPA)?
WPA Cipher Suite	Select the Cipher Suite for WPA encryption. 4.18 What is Temporal Key Integrity Protocol (TKIP)? 4.19 What is Advanced Encryption Standard (AES)?
WPA2 Cipher Suite	Select the Cipher Suite for WPA2 encryption.
Pre-Shared Key Format	While Encryption is selected to be WPA. Select the Pre-shared key format from the pull-down menu. The format can be Passphrase or Hex (64 characters). [WPA, Personal(Pre-Shared Key) only]
Pre-Shared Key	Fill in the key value. [WPA, Personal(Pre-Shared Key) only]
Enable Pre-Authentication	Click to enable Pre-Authentication. [WPA2/WPA2 Mixed only, Enterprise only]
Authentication RADIUS Server	Set the IP address, port and login password information of authentication RADIUS sever.
Apply Changes	Click the Apply Changes button to complete the new configuration setting.
Reset	Click the Reset button to abort change and recover the previous configuration setting.

WEP encryption key (secret key) length:

Format \ Length	64-bit	128-bit
	ASCII	5 characters
HEX	10 hexadecimal codes	26 hexadecimal codes

3.3.6 Wireless - Access Control

If you enable wireless access control, only those clients whose wireless MAC addresses are in the access control list will be able to connect to your Access Point. When this option is enabled, no wireless clients will be able to connect if the list contains no entries.

Wireless Access Control

If you choose 'Allowed Listed', only those clients whose wireless MAC addresses are in the access control list will be able to connect to your Access Point. When 'Deny Listed' is selected, these wireless clients on the list will not be able to connect the Access Point.

Wireless Access Control Mode: Allow Listed ▼

MAC Address: Comment:

Apply Changes
Reset

Current Access Control List:

MAC Address	Comment	Select
00:02:72:81:86:01	ST-1	<input type="checkbox"/>
00:00:55:66:66:50	ST-2	<input type="checkbox"/>

Screen snapshot – Wireless Access Control

Item	Description
Wireless Access Control Mode	Click the <i>Disabled</i> , <i>Allow Listed</i> or <i>Deny Listed</i> of drop down menu choose wireless access control mode. This is a security control function; only those clients registered in the access control list can link to this WLAN Broadband Router.
MAC Address	Fill in the MAC address of client to register this WLAN Broadband Router access capability.
Comment	Fill in the comment tag for the registered client.
Apply Changes	Click the <i>Apply Changes</i> button to register the client to new configuration setting.
Reset	Click the <i>Reset</i> button to abort change and recover the previous configuration setting.
Current Access Control	It shows the registered clients that are allowed to link to

List	this WLAN Broadband Router.
Delete Selected	Click to delete the selected clients that will be access right removed from this WLAN Broadband Router.
Delete All	Click to delete all the registered clients from the access allowed list.
Reset	Click the Reset button to abort change and recover the previous configuration setting.

3.3.7 WDS Settings

Wireless Distribution System uses wireless media to communicate with other APs, like the Ethernet does. To do this, you must set these APs in the same channel and set MAC address of other AP that you want to communicate with in the table and then enable the WDS.

Screen snapshot – WDS Setup

Item	Description
Enable WDS	Click the check box to enable wireless distribution system. Refer to 4.21 What is Wireless Distribution System (WDS)?

MAC Address	Fill in the MAC address of AP to register the wireless distribution system access capability.
Data Rate	Select the transmission data rate from pull-down menu. Data rate can be auto-select, 1M to 54Mbps or MCS.
Comment	Fill in the comment tag for the registered AP.
Apply Changes	Click the Apply Changes button to register the AP to new configuration setting.
Reset	Click the Reset button to abort change and recover the previous configuration setting.
Set Security	Click button to configure wireless security like WEP(64bits), WEP(128bits), WPA(TKIP), WPA2(AES) or None
Show Statistics	It shows the TX, RX packets, rate statistics
Delete Selected	Click to delete the selected clients that will be removed from the wireless distribution system.
Delete All	Click to delete all the registered APs from the wireless distribution system allowed list.
Reset	Click the Reset button to abort change and recover the previous configuration setting.

I WDS Security Setup

Requirement: Set [Wireless]->[Basic Settings]->[Mode]->AP+WDS

This page is used to configure the wireless security between APs.

Refer to [3.3.6 Wireless Security Setup](#).

WDS Security Setup

This page allows you setup the wireless security for WDS. When enabled, you must make sure each WDS device has adopted the same encryption algorithm and Key.

Encryption: None ▼

WEP Key Format: ASCII (5 characters) ▼

Refresh
Connect

Screen snapshot – Wireless Site Survey

Item	Description
SSID	It shows the SSID of AP.
BSSID	It shows BSSID of AP.

Channel	It show the current channel of AP occupied.
Type	It show which type AP acts.
Encrypt	It shows the encryption status.
Signal	It shows the power level of current AP.
Select (Client Only)	Click to select AP or client you'd like to connect.
Refresh	Click the Refresh button to re-scan site survey on the screen.
Connect	Click the Connect button to establish connection.

3.3.9 WPS

This page allows you to change the setting for WPS (Wi-Fi Protected Setup). Using this feature could let your wireless client automatically synchronize its setting and connect to the Access Point in a minute without any hassle.

Screen snapshot – Wi-Fi Protected Setup

Item	Description
Disable WPS	Click on to disable the Wi-Fi Protected Setup function.
WPS Status	Show WPS status is Configured or UnConfigured .
Self-PIN Number	Fill in the PIN Number of AP to register the wireless distribution system access capability.

PIN Configuration	The Start PIN button provides tool to scan the wireless network. If any Access Point or IBSS is found, you could connect it automatically when client join WPS mode.
Push Button Configuration	The Start PBC button provides tool to scan the wireless network. If any Access Point or IBSS is found, you could connect it automatically when client join PBC mode.
Apply Changes	Click the Apply Changes button to complete the new configuration setting.
Reset	Click the Reset button to abort change and recover the previous configuration setting.
Current Key Info	Authentication : It shows the Authentication is opened or closed. Encryption : It shows the Encryption mode. Key : It shows the Encryption key.

3.3.10 Schedule

This page is to configure the wireless activation timestamp by users.

Screen snapshot – Wireless Schedule

Item	Description
Enable Wireless Schedule	Click on to enable the wireless schedule function.
Days	Click the one or more of days to set the rules.

Time	Click 24 hrs or set the starting time and ending time.
Apply Changes	Click the Apply Changes button to complete the new configuration setting.
Reset	Click the Reset button to abort change and recover the previous configuration setting.

3.3.11 LAN Interface Setup

This page is used to configure the parameters for local area network that connects to the LAN ports of your WLAN Broadband Router. Here you may change the setting for IP address, subnet mask, DHCP, etc.

LAN Interface Setup

This page is used to configure the parameters for local area network which connects to the LAN port of your Access Point. Here you may change the setting for IP address, subnet mask, DHCP, etc..

MAC Address	To restrict data transmission from local network on certain MAC addresses, fill in the MAC address and your comments on it.
Comments	Comments let you know about whys to restrict data from the MAC address.
Apply Changes	Click the Apply Changes button to register the MAC address to MAC filtering list.
Reset	Click the Reset button to abort change and recover the previous configuration setting.
Delete Selected	Click to delete the selected MAC address that will be removed from the MAC-filtering list.
Delete All	Click to delete all the registered entries from the MAC-filtering list.
Reset	Click the Reset button to abort change and recover the previous configuration setting.

3.3.16 Firewall - Port Forwarding

Entries in this table allow you to automatically redirect common network

services to a specific machine behind the NAT firewall. These settings are only necessary if you wish to host some sort of server like a web server or mail server on the private local network behind your Gateway's NAT firewall.

Port Forwarding

Entries in this table allow you to automatically redirect common network services to a specific machine behind the NAT firewall. These settings are only necessary if you wish to host some sort of server like a web server or mail server on the private local network behind your Gateway's NAT firewall.

Enable Port Forwarding
 IP Address: Protocol: Both Port Range: - Comment:

Current Port Forwarding Table:

Local IP Address	Protocol	Port Range	Comment	Select
192.168.1.201	TCP+UDP	20-21	FTP	<input type="checkbox"/>

Screen snapshot – Firewall - Port Forwarding

Item	Description
Enable Port Forwarding	Click to enable the Port Forwarding security function.
IP Address	To forward data packets coming from WAN to a specific IP address that hosted in local network behind the NAT firewall, fill in the IP address, protocol, port range and your comments.
Protocol	The <i>Protocol</i> can be TCP, UDP or Both.
Port Range	The <i>Port Range</i> for data transmission.
Comment	<i>Comments</i> let you know about whys to allow data packets forward to the IP address and port number.
Apply Changes	Click the <i>Apply Changes</i> button to register the IP address and port number to Port forwarding list.
Reset	Click the <i>Reset</i> button to abort change and recover the previous configuration setting.
Delete Selected	Click to delete the selected IP address and port number that will be removed from the port-forwarding list.
Delete All	Click to delete all the registered entries from the

port-forwarding list.

Reset Click the **Reset** button to abort change and recover the previous configuration setting.

3.3.17 Firewall – URL Filtering

URL Filtering is used to restrict users to access specific websites in internet.

Screen snapshot – Firewall – URL Filtering

Item	Description
Enable URL Filtering	Click to enable the URL Filtering function.
URL Address	Add one URL address.
Apply Changes	Click the Apply Changes button to save settings.
Reset	Click the Reset button to abort change and recover the previous configuration setting.
Delete Selected	Click to delete the selected URL address that will be removed from the URL Filtering list.
Delete All	Click to delete all the registered entries from the URL Filtering list.
Reset	Click the Reset button to abort change and recover the previous configuration setting.

3.3.18 Firewall - DMZ

A Demilitarized Zone is used to provide Internet services without sacrificing unauthorized access to its local private network. Typically, the DMZ host contains devices accessible to Internet traffic, such as Web (HTTP) servers, FTP servers, SMTP (e-mail) servers and DNS servers.

DMZ

A Demilitarized Zone is used to provide Internet services without sacrificing unauthorized access to its local private network. Typically, the DMZ host contains devices accessible to Internet traffic, such as Web (HTTP) servers, FTP servers, SMTP (e-mail) servers and DNS servers.

Enable DMZ

DMZ Host IP Address:

Screen snapshot – Firewall - DMZ

Item	Description
Enable DMZ	Click to enable the DMZ function.
DMZ Host IP Address	To support DMZ in your firewall design, fill in the IP address of DMZ host that can be access from the WAN interface.
Apply Changes	Click the Apply Changes button to register the IP address of DMZ host.
Reset	Click the Reset button to abort change and recover the previous configuration setting.

3.3.19 QoS

This page sets bandwidth control by IP or Mac address.

QoS

Entries in this table improve your online gaming experience by ensuring that your game traffic is prioritized over other network traffic, such as FTP or Web.

Enable QoS

Automatic Uplink Speed

Manual Uplink Speed (Kbps):

Automatic Downlink Speed

Manual Downlink Speed (Kbps):

QoS Rule Setting:

NAT	Click to enable or disable the NAT function
Transmit	Click to disable or RIP1, RIP2 the Transmit function.
Receive	Click to disable or RIP1, RIP2 the Transmit function.
Enable Static Route	Click to Enable the Static Router function
IP Address	Manually Specify the packets arrive at the destination.
Subnet Mask	The internal network can be avoided through the Internet
Default Gateway	of the packet exchange.
Metric	Fill in the Metric value. The default value is empty.
Interface	Click to select LAN or WAN interface.

Apply Changes	Click the Apply Changes button to complete the new configuration setting.
Reset	Click the Reset button to abort change and recover the previous configuration setting.
Show Route Table	Click button to show route table
Reset	Click the Reset button to abort change and recover the previous configuration setting.

3.3.21 Management - Statistics

This page shows the packet counters for transmission and reception regarding to wireless, Ethernet LAN and Ethernet WAN networks.

Statistics

This page shows the packet counters for transmission and reception regarding to wireless and Ethernet networks.

Wireless LAN	<i>Sent Packets</i>	1361
	<i>Received Packets</i>	25883
Ethernet LAN	<i>Sent Packets</i>	1529
	<i>Received Packets</i>	1269
Ethernet WAN	<i>Sent Packets</i>	597
	<i>Received Packets</i>	30386

Screen snapshot – Management - Statistics

Item	Description
Wireless LAN <i>Sent Packets</i>	It shows the statistic count of sent packets on the wireless LAN interface.
Wireless LAN <i>Received Packets</i>	It shows the statistic count of received packets on the wireless LAN interface.
Ethernet LAN <i>Sent Packets</i>	It shows the statistic count of sent packets on the Ethernet LAN interface.
Ethernet LAN <i>Received Packets</i>	It shows the statistic count of received packets on the Ethernet LAN interface.
Ethernet WAN <i>Sent Packets</i>	It shows the statistic count of sent packets on the Ethernet WAN interface.
Ethernet WAN <i>Received Packets</i>	It shows the statistic count of received packets on the Ethernet WAN interface.

Refresh Click the refresh the statistic counters on the screen.

3.3.22 Management - DDNS

This page is used to configure Dynamic DNS service to have DNS with dynamic IP address.

Dynamic DNS Setting

Dynamic DNS is a service, that provides you with a valid, unchanging, internet domain name (an URL) to go with that (possibly everchanging) IP-address.

Enable DDNS

Service Provider : DynDNS ▾

Domain Name : host.dyndns.org

User Name/Email:

Password/Key:

Note:
 For TZO, you can have a 30 days free trial [here](#) or manage your TZO account in [control panel](#)
 For DynDNS, you can create your DynDNS account [here](#)

Apply Change
Reset

Screen snapshot – Management – DDNS

Item	Description
Enable DDNS	Click the checkbox to enable DDNS service. Refer to 4.25 What is DDNS?
Service Provider	Click the drop down menu to pickup the right provider.
Domain Name	To configure the Domain Name.
User Name/Email	Configure User Name, Email.
Password/Key	Configure Password, Key.
Apply Change	Click the Apply Changes button to save the enable DDNS service.
Reset	Click the Reset button to abort change and recover the previous configuration setting.

3.3.23 Management - Time Zone Setting

This page is used to configure NTP client to get current time.

Time Zone Setting

You can maintain the system time by synchronizing with a public time server over the Internet.

Current Time : Yr Mon Day Hr Mn Sec

Time Zone Select :

Enable NTP client update

NTP server :
 (Manual IP Setting)

Screen snapshot – Management – Time Zone Settings

Item	Description
Current Time	It shows the current time.
Time Zone Select	Click the time zone in your country.
Enable NTP client update	Click the checkbox to enable NTP client update. Refer to 4.26 What is NTP Client?
NTP Server	Click select default or input NTP server IP address.
Apply Change	Click the Apply Changes button to save and enable NTP client service.
Reset	Click the Reset button to abort change and recover the previous configuration setting.
Refresh	Click the refresh the current time shown on the screen.

3.3.24 Management – Denial-of-Service

This page is used to enable and setup protection to prevent attack by hacker’s program. It provides more security for users.

Denial of Service

A "denial-of-service" (DoS) attack is characterized by an explicit attempt by hackers to prevent legitimate users of a service from using that service.

Enable DoS Prevention

Per-Source IP Flood...	

54

Select ALL	Click the checkbox to enable all prevention items.
Clear ALL	Click the checkbox to disable all prevention items.
Apply Changes	Click the Apply Changes button to save above settings.

3.3.25 Management - Log

This page is used to configure the remote log server and shown the current log.

Screen snapshot – Management – Log

Item	Description
Enable Log	Click the checkbox to enable log.
System all	Show all log of wireless broadband router
Wirelessy	Only show wireless log
DoS	Only show Denial-of-Service log
Enable Remote Log	Click the checkbox to enable remote log service.
Log Server IP Address	Input the remote log IP address
Apply Changes	Click the Apply Changes button to save above settings.
Refresh	Click the refresh the log shown on the screen.
Clear	Clear log display screen

3.3.26 Management - Upgrade Firmware

This page allows you upgrade the Access Point firmware to new version. Please note, do not power off the device during the upload because it may crash the system.

Upgrade Firmware

This page allows you upgrade the Access Point firmware to new version. Please note, do not power off the device during the upload because it may crash the system.

Select File:

Screen snapshot – Management - Upgrade Firmware

Item	Description
Select File	Click the <i>Browse</i> button to select the new version of web firmware image file.
Upload	Click the <i>Upload</i> button to update the selected web firmware image to the WLAN Broadband Router.
Reset	Click the <i>Reset</i> button to abort change and recover the previous configuration setting.

3.3.27 Management Save/ Reload Settings

This page allows you save current settings to a file or reload the settings from the file that was saved previously. Besides, you could reset the current configuration to factory default.

Save/Reload Settings

This page allows you save current settings to a file or reload the settings from the file which was saved previously. Besides, you could reset the current configuration to factory default.

Save Settings to File:

Load Settings from File:

Reset Settings to Default:

Screen snapshot – Management - Save/Reload Settings

Item	Description
Save Settings to File	Click the Save button to download the configuration parameters to your personal computer.
Load Settings from File	Click the Browse button to select the configuration files then click the Upload button to update the selected configuration to the WLAN Broadband Router.
Reset Settings to Default	Click the Reset button to reset the configuration parameter to factory defaults.

3.3.28 Management - Password Setup

This page is used to set the account to access the web server of Access Point. Empty user name and password will disable the protection.

Screen snapshot – Management - Password Setup

Item	Description
User Name	Fill in the user name for web management login control.
New Password	Fill in the password for web management login control.
Confirmed Password	Because the password input is invisible, so please fill in the password again for confirmation purpose.
Apply Changes	Clear the User Name and Password fields to empty, means to apply no web management login control. Click the Apply Changes button to complete the new configuration setting.
Reset	Click the Reset button to abort change and recover the previous configuration setting.

4 Frequently Asked Questions (FAQ)

4.1 What and how to find my PC's IP and MAC address?

IP address is the identifier for a computer or device on a TCP/IP network. Networks using the TCP/IP protocol route messages based on the IP address of the destination. The format of an IP address is a 32-bit numeric address written as four numbers separated by periods. Each number can be zero to 255. For example, 191.168.1.254 could be an IP address.

The MAC (Media Access Control) address is your computer's unique hardware number. (On an Ethernet LAN, it's the same as your Ethernet address.) When you're connected to the Internet from your computer (or host as the Internet protocol thinks of it), a correspondence table relates your IP address to your computer's physical (MAC) address on the LAN.

To find your PC's IP and MAC address,

- ✓ Open the Command program in the Microsoft Windows.
 - ✓ Type in *ipconfig /all* then press the *Enter* button.
- Your PC's IP address is the one entitled IP Address and your PC's MAC address is the one entitled Physical Address.

4.2 What is Wireless LAN?

A wireless LAN (WLAN) is a network that allows access to Internet without the need for any wired connections to the user's machine.

4.3 What are ISM bands?

ISM stands for Industrial, Scientific and Medical; radio frequency bands that the Federal Communications Commission (FCC) authorized for wireless LANs. The ISM bands are located at 915 +/- 13 MHz, 2450 +/- 50 MHz and 5800 +/- 75 MHz.

4.4 How does wireless networking work?

The 802.11 standard define two modes: infrastructure mode and ad hoc mode. In infrastructure mode, the wireless network consists of at least one access point connected to the wired network infrastructure and a set of wireless end stations. This configuration is called a Basic Service Set (BSS). An Extended Service Set (ESS) is a set of two or

more BSSs forming a single subnetwork. Since most corporate WLANs require access to the wired LAN for services (file servers, printers, Internet links) they will operate in infrastructure mode.

Example 1: wireless Infrastructure Mode

Ad hoc mode (also called peer-to-peer mode or an Independent Basic Service Set, or IBSS) is simply a set of 802.11 wireless stations that communicate directly with one another without using an access point or any connection to a wired network. This mode is useful for quickly and easily setting up a wireless network anywhere that a wireless infrastructure does not exist or is not required for services, such as a hotel room, convention center, or airport, or where access to the wired network is barred (such as for consultants at a client site).

Example 2: wireless Ad Hoc Mode

4.5 What is BSSID?

A six-byte address that distinguishes a particular a particular access point from others. Also know as just SSID. Serves as a network ID or name.

4.6 What is ESSID?

The Extended Service Set ID (ESSID) is the name of the network you want to access. It is used to identify different wireless networks.

4.7 What are potential factors that may causes interference?

Factors of interference:

- Obstacles: walls, ceilings, furniture... etc.
- Building Materials: metal door, aluminum studs.
- Electrical devices: microwaves, monitors and electrical motors.

Solutions to overcome the interferences:

- ✓ Minimizing the number of walls and ceilings.
- ✓ Position the WLAN antenna for best reception.
- ✓ Keep WLAN devices away from other electrical devices, eg: microwaves, monitors, electric motors, ... etc.
- ✓ Add additional WLAN Access Points if necessary.

4.8 What are the Open System and Shared Key authentications?

IEEE 802.11 supports two subtypes of network authentication services: open system and shared key. Under open system authentication, any wireless station can request authentication. The station that needs to authenticate with another wireless station sends an authentication management frame that contains the identity of the sending station. The receiving station then returns a frame that indicates whether it recognizes the sending station. Under shared key authentication, each wireless station is assumed to have received a secret shared key over a secure channel that is independent from the 802.11 wireless network communications channel.

4.9 What is WEP?

An optional IEEE 802.11 function that offers frame transmission privacy similar to a wired network. The Wired Equivalent Privacy generates secret shared encryption keys that both source and destination stations can use to alert frame bits to avoid disclosure to eavesdroppers.

WEP relies on a secret key that is shared between a mobile station (e.g. a laptop with a wireless Ethernet card) and an access point (i.e. a base station). The secret key is used to encrypt packets before they are transmitted, and an integrity check is used to ensure that packets are not modified in transit.

4.10 What is Fragment Threshold?

The proposed protocol uses the frame fragmentation mechanism defined in IEEE 802.11 to achieve parallel transmissions. A large data frame is fragmented into several fragments each of size equal to fragment threshold. By tuning the fragment threshold

value, we can get varying fragment sizes. The determination of an efficient fragment threshold is an important issue in this scheme. If the fragment threshold is small, the overlap part of the master and parallel transmissions is large. This means the spatial reuse ratio of parallel transmissions is high. In contrast, with a large fragment threshold, the overlap is small and the spatial reuse ratio is low. However high fragment threshold leads to low fragment overhead. Hence there is a trade-off between spatial re-use and fragment overhead.

Fragment threshold is the maximum packet size used for fragmentation. Packets larger than the size programmed in this field will be fragmented.

If you find that your corrupted packets or asymmetric packet reception (all send packets, for example). You may want to try lowering your fragmentation threshold. This will cause packets to be broken into smaller fragments. These small fragments, if corrupted, can be resent faster than a larger fragment. Fragmentation increases overhead, so you'll want to keep this value as close to the maximum value as possible.

4.11 What is RTS (Request To Send) Threshold?

The RTS threshold is the packet size at which packet transmission is governed by the RTS/CTS transaction. The IEEE 802.11-1997 standard allows for short packets to be transmitted without RTS/CTS transactions. Each station can have a different RTS threshold. RTS/CTS is used when the data packet size exceeds the defined RTS threshold. With the CSMA/CA transmission mechanism, the transmitting station sends out an RTS packet to the receiving station, and waits for the receiving station to send back a CTS (Clear to Send) packet before sending the actual packet data.

This setting is useful for networks with many clients. With many clients, and a high network load, there will be many more collisions. By lowering the RTS threshold, there may be fewer collisions, and performance should improve. Basically, with a faster RTS threshold, the system can recover from problems faster. RTS packets consume valuable bandwidth, however, so setting this value too low will limit performance.

4.12 What is Beacon Interval?

In addition to data frames that carry information from higher layers, 802.11 includes management and control frames that support data transfer. The beacon frame, which is a type of management frame, provides the "heartbeat" of a wireless LAN, enabling stations to establish and maintain communications in an orderly fashion.

Beacon Interval represents the amount of time between beacon transmissions. Before a station enters power save mode, the station needs the beacon interval to know when to wake up to receive the beacon (and learn whether there are buffered frames at the access point).

4.13 What is Preamble Type?

There are two preamble types defined in IEEE 802.11 specification. A long preamble basically gives the decoder more time to process the preamble. All 802.11 devices support a long preamble. The short preamble is designed to improve efficiency (for example, for VoIP systems). The difference between the two is in the Synchronization field. The long preamble is 128 bits, and the short is 56 bits.

4.14 What is SSID Broadcast?

Broadcast of SSID is done in access points by the beacon. This announces your access point (including various bits of information about it) to the wireless world around it. By disabling that feature, the SSID configured in the client must match the SSID of the access point.

Some wireless devices don't work properly if SSID isn't broadcast (for example the D-link DWL-120 USB 802.11b adapter). Generally if your client hardware supports operation with SSID disabled, it's not a bad idea to run that way to enhance network security. However it's no replacement for WEP, MAC filtering or other protections.

4.15 What is Wi-Fi Protected Access (WPA)?

Wi-Fi's original security mechanism, Wired Equivalent Privacy (WEP), has been viewed as insufficient for securing confidential business communications. A longer-term solution, the IEEE 802.11i standard, is under development. However, since the IEEE 802.11i standard is not expected to be published until the end of 2003, several members of the WI-Fi Alliance teamed up with members of the IEEE 802.11i task group to develop a significant near-term enhancement to Wi-Fi security. Together, this team developed Wi-Fi Protected Access.

To upgrade a WLAN network to support WPA, Access Points will require a WPA software upgrade. Clients will require a software upgrade for the network interface card, and possibly a software update for the operating system. For enterprise networks, an authentication server, typically one that supports RADIUS and the selected EAP authentication protocol, will be added to the network.

4.16 What is WPA2?

It is the second generation of WPA. WPA2 is based on the final IEEE 802.11i amendment to the 802.11 standard.

4.17 What is 802.1x Authentication?

802.1x is a framework for authenticated MAC-level access control, defines Extensible Authentication Protocol (EAP) over LANs (WAPOL). The standard encapsulates and leverages much of EAP, which was defined for dial-up authentication with Point-to-Point Protocol in RFC 2284.

Beyond encapsulating EAP packets, the 802.1x standard also defines EAPOL messages that convey the shared key information critical for wireless security.

4.18 What is Temporal Key Integrity Protocol (TKIP)?

The Temporal Key Integrity Protocol, pronounced tee-kip, is part of the IEEE 802.11i encryption standard for wireless LANs. TKIP is the next generation of WEP, the Wired Equivalency Protocol, which is used to secure 802.11 wireless LANs. TKIP provides per-packet key mixing, a message integrity check and a re-keying mechanism, thus fixing the flaws of WEP.

4.19 What is Advanced Encryption Standard (AES)?

Security issues are a major concern for wireless LANs, AES is the U.S. government's next-generation cryptography algorithm, which will replace DES and 3DES.

4.20 What is Inter-Access Point Protocol (IAPP)?

The IEEE 802.11f Inter-Access Point Protocol (IAPP) supports Access Point Vendor interoperability, enabling roaming of 802.11 Stations within IP subnet.

IAPP defines messages and data to be exchanged between Access Points and between the IAPP and high layer management entities to support roaming. The IAPP protocol uses TCP for inter-Access Point communication and UDP for RADIUS request/response exchanges. It also uses Layer 2 frames to update the forwarding tables of Layer 2 devices.

4.21 What is Wireless Distribution System (WDS)?

The Wireless Distribution System feature allows WLAN AP to talk directly to other APs via wireless channel, like the wireless bridge or repeater service.

4.22 What is Universal Plug and Play (uPNP)?

UPnP is an open networking architecture that consists of services, devices, and control points. The ultimate goal is to allow data communication among all UPnP devices regardless of media, operating system, programming language, and wired/wireless connection.

4.23 What is Maximum Transmission Unit (MTU) Size?

Maximum Transmission Unit (MTU) indicates the network stack of any packet is larger than this value will be fragmented before the transmission. During the PPP negotiation, the peer of the PPP connection will indicate its MRU and will be accepted. The actual MTU of the PPP connection will be set to the smaller one of MTU and the peer's MRU. The default is value 1400.

4.24 What is Clone MAC Address?

Clone MAC address is designed for your special application that request the clients to register to a server machine with one identified MAC address.

Since that all the clients will communicate outside world through the WLAN Broadband Router, so have the cloned MAC address set on the WLAN Broadband Router will solve the issue.

4.25 What is DDNS?

DDNS is the abbreviation of Dynamic Domain Name Server. It is designed for user own the DNS server with dynamic WAN IP address.

4.26 What is NTP Client?

NTP client is designed for fetching the current timestamp from internet via Network Time protocol. User can specify time zone, NTP server IP address.

4.27 What is VPN?

VPN is the abbreviation of Virtual Private Network. It is designed for creating point-to-point private link via shared or public network.

4.28 What is IPSEC?

IPSEC is the abbreviation of IP Security. It is used to transferring data securely under VPN.

4.29 What is WLAN Block Relay Between Clients?

An Infrastructure Basic Service Set is a BSS with a component called an *Access Point* (AP). The access point provides a local relay function for the BSS. All stations in the BSS communicate with the access point and no longer communicate directly. All frames are relayed between stations by the access point. This local relay function effectively doubles the range of the IBSS

4.30 What is WMM?

WMM is based on a subset of the IEEE 802.11e WLAN QoS draft standard. WMM adds prioritized capabilities to Wi-Fi networks and optimizes their performance when multiple concurring applications, each with different latency and throughput requirements, compete for network resources. By using WMM, end-user satisfaction is maintained in a wider variety of environments and traffic conditions. WMM makes it possible for home network users and enterprise network managers to decide which data streams are most important and assign them a higher traffic priority.

4.31 What is WLAN ACK TIMEOUT?

ACK frame has to receive ACK timeout frame. If remote does not receive in specified period, it will be retransmitted.

4.32 What is Modulation Coding Scheme (MCS)?

MCS is Wireless link data rate for 802.11n. The throughput/range performance of a AP will depend on its implementation of coding schemes. MCS includes variables such as the number of spatial streams, modulation, and the data rate on each stream. Radios establishing and maintaining a link must automatically negotiate the optimum MCS based on channel conditions and then continuously adjust the selection of MCS as conditions change due to interference, motion, fading, and other events.

4.33 What is Frame Aggregation?

Every 802.11 packet, no matter how small, has a fixed amount of overhead associated with it. Frame Aggregation combines multiple smaller packets together to form one larger packet. The larger packet can be sent without the overhead of the individual packets. This technique helps improve the efficiency of the 802.11n radio allowing more end user data to be sent in a given time.

4.34 What is Guard Intervals (GI)?

A GI is a period of time between symbol transmission that allows reflections (from multipath) from the previous data transmission to settle before transmitting a new

symbol.

The 802.11n draft specifies two guard intervals: 400ns (short) and 800ns (long).

Support of the 400ns GI is optional for transmit and receive. The purpose of a guard interval is to introduce immunity to propagation delays, echoes, and reflections to which digital data is normally very sensitive.

5 Configuration Examples

5.1 Example One – PPPoE on the WAN

Sales division of Company ABC likes to establish a WLAN network to support mobile communication on sales' Notebook PCs. MIS engineer collects information and plans the WLAN Broadband Router implementation by the following configuration.

WAN configuration:

PPPoE

User Name	H890123456
Password	PW192867543210

LAN configuration

IP Address	192.168.1.254
Subnet Mask	255.255.255.0
Default Gateway	0.0.0.0
DHCP Client Range	192.168.1.100 – 192.168.1.200

WLAN configuration

SSID	MyWLAN
Channel Number	11

Figure 3 – Configuration Example One – PPPoE on the WAN

Configure the WAN interface:

Open WAN Interface Setup page, select PPPoE then enter the User Name “**H890123456**” and Password “**PW192867543210**”, the password is encrypted to display on the screen.

Press  button to confirm the configuration setting.

WAN Interface Setup

This page is used to configure the parameters for Internet network which connects to the WAN port of your Access Point. Here you may change the access method to static IP, DHCP, PPPoE or PPTP by click the item value of WAN Access type.

WAN Access Type: PPPoE

User Name:

Password:

Service Name:

Connection Type: Continuous Connect Disconnect

Idle Time: (1-1000 minutes)

MTU Size: (1360-1492 bytes)

Attain DNS Automatically

Set DNS Manually

DNS 1:

DNS 2:

DNS 3:

Clone MAC Address:

Enable uPNP

Enable IGMP Proxy

Enable Ping Access on WAN

Enable Web Server Access on WAN

Enable IPsec pass through on VPN connection

Enable PPTP pass through on VPN connection

Enable LZTP pass through on VPN connection

Apply Changes Reset

Configure the LAN interface:

Open LAN Interface Setup page, enter the IP Address “**192.168.1.254**”, Subnet Mask “**255.255.255.0**”, Default Gateway “**0.0.0.0**”, enable DHCP Server, DHCP client range “**192.168.1.100**” to “**192.168.1.200**”.

Press  button to confirm the configuration setting.

LAN Interface Setup

This page is used to configure the parameters for local area network which connects to the LAN port of your Access Point. Here you may change the setting for IP address, subnet mask, DHCP, etc..

IP Address:

Subnet Mask:

Default Gateway:

DHCP: Server

DHCP Client Range: - Show Client

Static DHCP: Enabled Set Static DHCP

Domain Name:

802.1d Spanning Tree: Disabled

Clone MAC Address:

Apply Changes Reset

Configure the WLAN interface:

Open WLAN Interface Setup page, enter the SSID “MyWLAN”, Channel Number “11”.

Press  button to confirm the configuration setting.

Wireless Basic Settings

This page is used to configure the parameters for wireless LAN clients which may connect to your Access Point. Here you may change wireless encryption settings as well as wireless network parameters.

Disable Wireless LAN Interface

5.2 Example Two – Fixed IP on the WAN

Company ABC likes to establish a WLAN network to support mobile communication on all employees’ Notebook PCs. MIS engineer collects information and plans the WLAN Broadband Router implementation by the following configuration.

WAN configuration:

Fixed IP

<i>IP Address</i>	192.168.2.254
<i>Subnet Mask</i>	255.255.255.0
<i>Default Gateway</i>	192.168.2.10
<i>DNS Address</i>	168.95.1.1

LAN configuration

<i>IP Address</i>	192.168.1.254
<i>Subnet Mask</i>	255.255.255.0
<i>Default Gateway</i>	192.168.2.254
<i>DHCP Client Range</i>	192.168.1.100 – 192.168.1.200

WLAN configuration

<i>SSID</i>	MyWLAN
<i>Channel Number</i>	11

Figure 4 – Configuration Example Two – Fixed IP on the WAN

Configure the WAN interface:

Open WAN Interface Setup page, select Fixed IP then enter IP Address “**192.168.2.254**”, subnet mask “**255.255.255.0**”, Default gateway “**192.168.2.10**”.

Press  button to confirm the configuration the setting.

WAN Interface Setup

This page is used to configure the parameters for Internet network which connects to the WAN port of your Access Point. Here you may change the access method to static IP, DHCP, PPPoE or PPTP by click the item value of WAN Access type.

WAN Access Type: Static IP

IP Address:

Subnet Mask:

Default Gateway:

MTU Size: (1400-1500 bytes)

DNS 1:

DNS 2:

DNS 3:

Clone MAC Address:

- Enable uPNP
- Enable IGMP Proxy
- Enable Ping Access on WAN
- Enable Web Server Access on WAN
- Enable IPsec pass through on VPN connection
- Enable PPTP pass through on VPN connection
- Enable LZTP pass through on VPN connection

Configure the LAN interface:

Open LAN Interface Setup page, enter the IP Address “192.168.1.254”, Subnet Mask “255.255.255.0”, enable DHCP Server, DHCP client range “192.168.1.100” to “192.168.1.200”.

Press 

button to confirm the configuration setting.

FEDERAL COMMUNICATIONS COMMISSION INTERFERENCE STATEMENT

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

CAUTION :

Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions:

- (1) This device may not cause harmful interference.
- (2) This device must accept any interference received, including interference that may cause undesired operation.

FCC RF Radiation Exposure Statement :

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. End users must follow the specific operating instructions for satisfying RF exposure compliance. This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter. This equipment has been SAR-evaluated for use in hand. SAR measurements are based on a 5mm spacing from the body and that compliance is achieved at that distance.

We, hereby, declare that this WEthernet-2-WiFi Universal Wireless Adapter is in compliance with the essential requirements and other relevant provisions of Directive 1999/5/EC.
