

# **802.11n 3G Router with USB2.0 Port**

User's Manual

# Federal Communication Commission

## Interference Statement

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications.

However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is needed.
- Consult the dealer or an experienced radio/TV technician for help.

Warning: Changes or modifications to this unit not expressly approved by the party responsible for compliance could void the user authority to operate the equipment.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

The user's manual or instruction manual for an intentional or unintentional radiator shall caution the user that changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

### CAUTION:

1. To comply with FCC RF exposure compliance requirements, a separation distance of at least 20 cm must be maintained between the antenna of this device and all persons.
2. This Transmitter must not be co-located or operating in conjunction with any other antenna or transmitter

# Chapter 1: Introduction

The **802.11n 3G Router with USB2.0 Port** is a draft 802.11n/b/g compliant Wireless Broadband Router with 4-port Fast Ethernet Switch. **802.11n 3G Router with USB2.0 Port** with latest Draft 802.11n technology that delivers up to 150Mbps wireless, provides multi-functional capabilities, particularly the high-performance throughput and high-quality security to propose an integrated, thorough SOHO solution. The incredible speed of **802.11n 3G Router with USB2.0 Port** makes it ideal for media-centric applications like streaming video, gaming, and Voice over IP technology, ensure optimum performance and maximum coverage with an external antenna. With the 3G Router, government employees or corporate users can create a wireless network and provide colleagues with remote access to their secure private networks. By installing the 3G Router on a bus, train, or even a boat, you can allow passengers to check e-mail or chat online while commuting.

## Features

- Support the IEEE 802.11n/b/g standard, high speed data rate up to 150Mbps
- Support WPS (Wi-Fi Protected Setup) with reset button
- High security with build-in Security: WEP 64/128, WPA-PSK, WPA-2PSK, WPA, WPA2, 802.1x and 802.11i
- Support Gateway, WDS (Bridge + Repeater)
- Support USB 3.5G (HSDPA) device
- Easy configuration for home user setup

## Physical Details

### Front LEDs

LED Behavior				
LED	Printed	Color	Behavior	Indication
Power/ WPS	Power/ WPS	Green	ON	Power on/ WPS function active
			OFF	Power off

			Blinking	WPS is enabled to make a connection
WLAN	WLAN	Green	OFF	WLAN function off
			ON	WLAN link / active
			Blinking	WLAN traffic transmitting
WAN	WAN	Green	ON	WAN link / active
			OFF	WAN function off
			Blinking	WAN traffic transmitting
LAN 1~4		Green	OFF	LAN function off
			ON	LAN link / active
			Blinking	LAN traffic transmitting

## Rear Panel

Install attached antenna here

<b>WPS</b>	To enable the WPS function via web configuration (Wireless > WPS), then press the WPS button once on the Wireless Router, the WPS LED will start to flash. To make a connection with other WPS supported device within 3 minutes.
<b>RESET</b>	Keep on pressing the Reset button more than 3 seconds, the Wireless Router will set all setting back to factory default values.
<b>LAN 1~4</b>	Use standard LAN cables (RJ45 connectors) to connect your PCs to the port. If required, any port can be connected to another hub. Any LAN port will automatically function as an "Uplink" port when necessary.
<b>WAN</b>	Connect the ADSL or Cable Modem here with RJ45 cable. If your modem came with a cable, use the supplied cable, otherwise, use a standard LAN cable.
<b>POWER</b>	Connect the power supply adapter here.

## Side Panel

USB 2.0 Port

<b>USB 2.0 Port</b>	Insert the USB 3.5G card that provided by your ISP(Internet Service Provider) here.
---------------------	---

# Chapter 2: About Operation Modes

Please go to the **Wireless> WDS** to set up the WDS function (Bridge or Repeater) of the Wireless Router.

## Gateway Mode

The wireless connection will be set up from a point-to-point local LAN into a point-to-multipoint WAN. This device connects all the stations (PC/notebook with wireless function) to a wireless network. All stations can have the Internet access if only the device has the Internet connection.

## Bridge (WDS) Mode

The WDS (Wireless Distributed System) function lets this access point act as a wireless LAN access point and repeater at the same time. Users can use this feature to build up a large wireless network in a large space like airports, hotels and schools and so on. This feature is also useful when users want to bridge networks between buildings where it is impossible to deploy network cable connections between these buildings.

In this mode, all Ethernet ports and wireless interface are bridge together and NAT function is disabled. All the WAN related function and firewall are not supported.

Wireless Distribution System uses wireless media to communicate with other APs, like the Ethernet does. To do this, you must set these APs in the same **channel** and **wireless MAC address** to each other APs that you want to communicate with.

## Repeater (WDS+AP) Mode

If set to Repeater mode, a device connects to each other through an access point or a base station (gateway or router.) This device can also work like a wireless station when it's connected to a computer directly, so that the computer can send packets from wired end to wireless interface.

# Chapter 3: Configuration

## Hardware Connection

1. Connect one end of the Ethernet cable to the LAN port of the Wireless Router, another end to your PC or notebook.
2. There are two connection methods to connect to Internet (**Only one can be selected**):
  - Connect Ethernet cable one end to the WAN port of the Wireless Router, the other end to the ADSL or cable modem.
  - Or you can insert USB 3.5G card (that provide by your ISP) into USB port.
3. Finally, connect the Wireless Router with a power to an outlet.

## Login

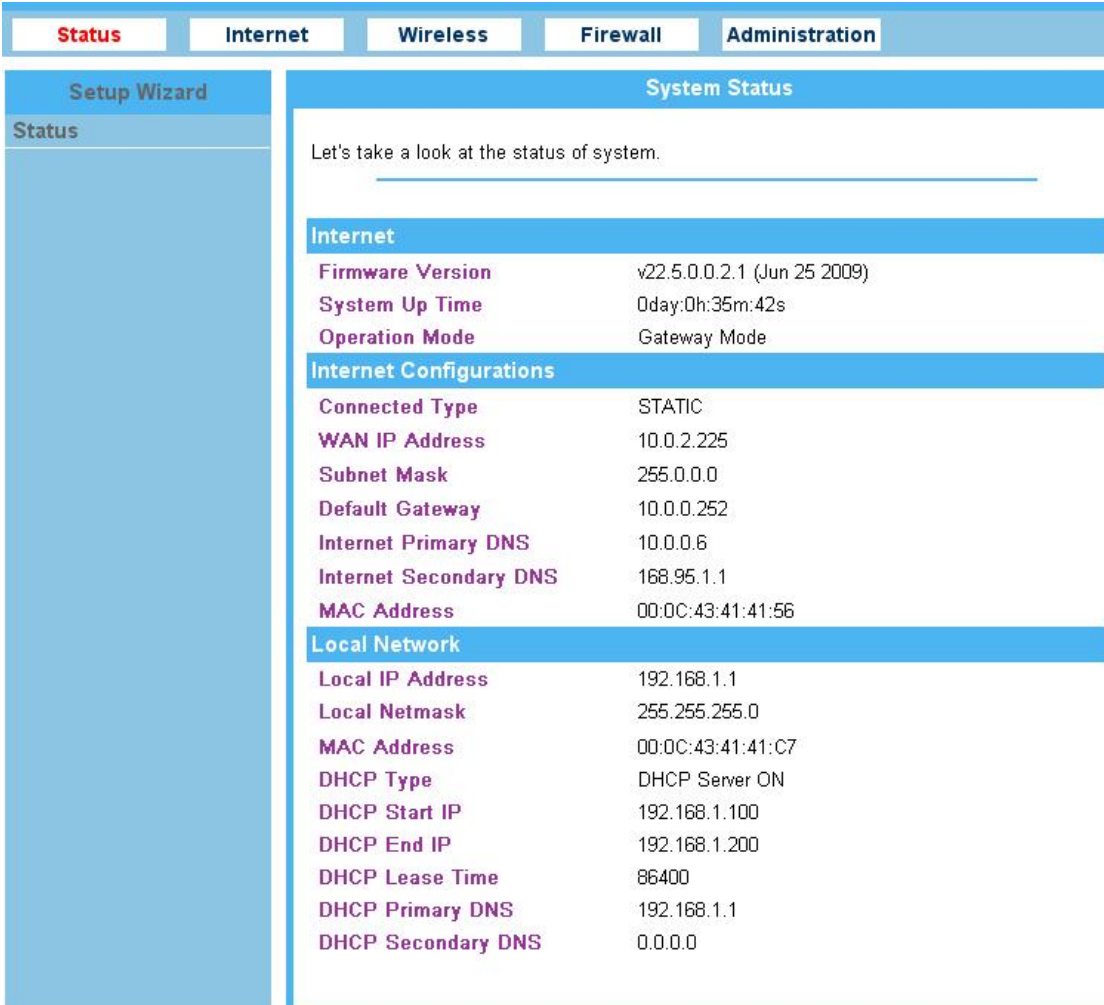

1. Start your computer and make sure the connection by an Ethernet cable between your computer and the Wireless Router.
2. Start your Web Browser.
3. In the *Address* box, enter the IP address of the Wireless Router, as in this example, which uses the Wireless Router's default IP address: <http://192.168.1.1>

- After connected successfully, the following screen will show up. Simply enter the username “admin” and password “password” to login.

A login dialog box titled "Connect to 192.168.1.1" with a question mark and close button in the top right. The dialog contains a key icon, a "User name:" field with a dropdown menu showing "admin", a "Password:" field with masked characters, a "Remember my password" checkbox, and "OK" and "Cancel" buttons at the bottom.

The router administration interface shows a navigation menu with "Status", "Internet", "Wireless", "Firewall", and "Administration". The "Status" page is active, displaying "System Status" information. A sidebar on the left contains "Setup Wizard" and "Status".

**System Status**

Let's take a look at the status of system.

**Internet**

<b>Firmware Version</b>	v22.5.0.0.2.1 (Jun 25 2009)
<b>System Up Time</b>	0day:0h:35m:42s
<b>Operation Mode</b>	Gateway Mode

**Internet Configurations**

<b>Connected Type</b>	STATIC
<b>WAN IP Address</b>	10.0.2.225
<b>Subnet Mask</b>	255.0.0.0
<b>Default Gateway</b>	10.0.0.252
<b>Internet Primary DNS</b>	10.0.0.6
<b>Internet Secondary DNS</b>	168.95.1.1
<b>MAC Address</b>	00:0C:43:41:41:56

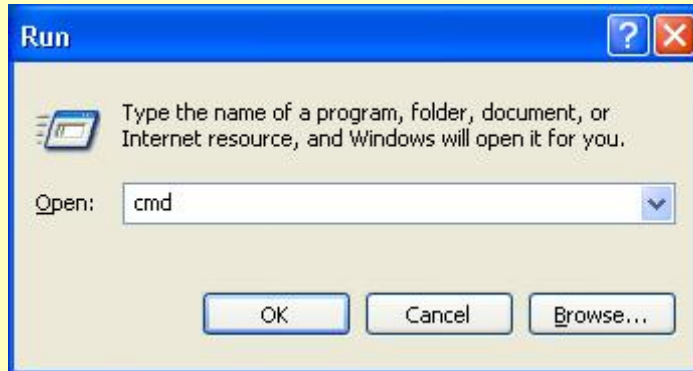

**Local Network**

<b>Local IP Address</b>	192.168.1.1
<b>Local Netmask</b>	255.255.255.0
<b>MAC Address</b>	00:0C:43:41:41:C7
<b>DHCP Type</b>	DHCP Server ON
<b>DHCP Start IP</b>	192.168.1.100
<b>DHCP End IP</b>	192.168.1.200
<b>DHCP Lease Time</b>	86400
<b>DHCP Primary DNS</b>	192.168.1.1
<b>DHCP Secondary DNS</b>	0.0.0.0

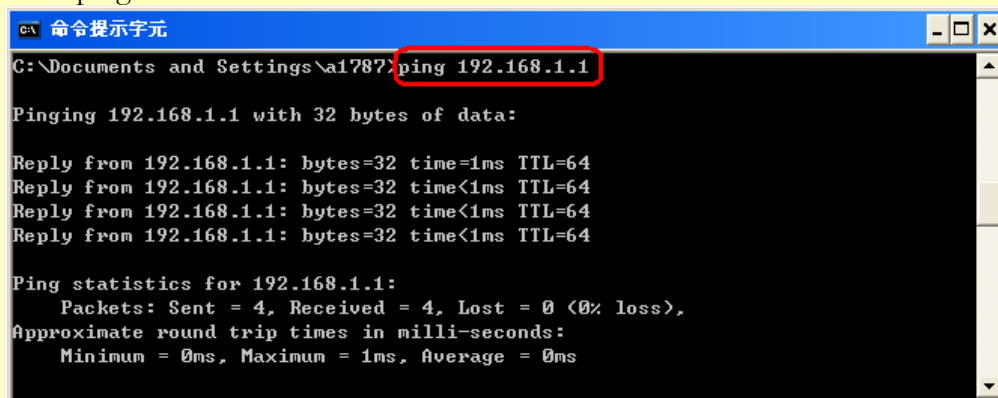

## If you cannot connect...

If the Wireless Router does not respond, check the following:

- The Wireless Router is properly installed, LAN connection is OK, and it is powered ON. You can test the connection by using the "Ping" command:
- Please go to **Start>Run...>** Enter "cmd" command in the column to open the MS-DOS window.

- Enter the command:  
ping 192.168.1.1

```
C:\Documents and Settings\al787>ping 192.168.1.1

Pinging 192.168.1.1 with 32 bytes of data:

Reply from 192.168.1.1: bytes=32 time<1ms TTL=64
Reply from 192.168.1.1: bytes=32 time<1ms TTL=64
Reply from 192.168.1.1: bytes=32 time<1ms TTL=64
Reply from 192.168.1.1: bytes=32 time<1ms TTL=64

Ping statistics for 192.168.1.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 0ms
```

If no response is received, either the connection is not working, or your PC's IP address is not compatible with the Wireless Router's IP Address. (See next item.)

- If your PC is using a fixed IP Address, its IP Address must be within the range 192.168.1.2 to 192.168.1.254 to be compatible with the Wireless Router's default IP Address of 192.168.1.1. Also, the Network *Mask* must be set to 255.255.255.0. See [Chapter 4 - PC Configuration](#) for details on checking your PC's TCP/IP settings.
- Ensure that your PC and the Wireless Router are on the same network segment. (If you don't have a router, this must be the case.)
- Ensure you are using the wired LAN interface. The Wireless interface can only be used if its configuration matches your PC's wireless settings.

## Common Connection Types

The Internet connection type according to the ISP (Internet Service Provider) that you selected.

### Cable Modems

Type	Details	ISP Data required
Dynamic IP Address	Your IP Address is allocated automatically, when you connect to you ISP.	Usually, none. However, some ISP's may require you to use a particular Hostname, Domain name, or MAC (physical) address.
Static (Fixed) IP Address	Your ISP allocates a permanent IP Address to you.	IP Address allocated to you. Some ISP's may also require you to use a particular Hostname, Domain name, or MAC (physical) address.

### DSL Modems

Type	Details	ISP Data required
Dynamic IP Address	Your IP Address is allocated automatically, when you connect to you ISP.	None.
Static (Fixed) IP Address	Your ISP allocates a permanent IP Address to you.	IP Address allocated to you.
PPPoE	You connect to the ISP only when required. The IP address is usually allocated automatically.	User name and password.

### Other Modems (e.g. 3.5G Wireless card)

Type	Details	ISP Data required
Dynamic IP Address	Your IP Address is allocated automatically, when you connect to you ISP.	The ISP's may require you to use a particular Hostname, Domain name, or MAC (physical) address.

# Setup Wizard

## Step 1- WAN Connect Detection

This page is used to detect the WAN connection of network. User can select **Auto Detect** form the pull-down menu and click **Start Auto Detect** button, the system will detect whether there is WAN connection or not. If user wants to set up the WAN detection manually, please select **Manual** form the pull-down menu, then click **Next** to continue.

**Select** Auto Detect ▼

**WAN Detection** Start Auto Detect

**Detect Result**

Next >>

<b>Select</b>	To use the WAN detect function, user can select <b>Manual</b> or <b>Auto Detect</b> form the pull-down menu.
<b>WAN Detection</b>	Select <b>Auto Detect</b> form the pull-down menu and click <b>Start Auto Detect</b> button, the detecting screen will be pop-up to detect whether there is WAN connection or not. If user wants to set up the WAN detection manually, please select <b>Manual</b> form the pull-down menu, then click <b>Next</b> to continue.
<b>Detect Result</b>	Here shows the WAN detection result. If there is no WAN connection, the system will show <b>NONE</b> or <b>Unplugged Cable</b> .

## Step 2- WAN Access Type

Here user can set up the WAN connection type easily. Select the WAN Connection Type **Static (Fixed IP)**, **DHCP (Auto Config)**, **PPPoE(ADSL)**, or **3G (DIAL)** and click **Next** to continue.

**WAN Connection Type** DHCP (Auto Config) ▼

Cancel << Back Next >>

<b>WAN Access Type</b>	<b>Static (Fixed IP)</b>
	<b>WAN Connection Type</b> <span style="float: right;">Static (Fixed IP) ▼</span>
	<b>IP Address</b> <span style="float: right;">10.10.10.1</span>
	<b>Subnet Mask</b> <span style="float: right;">255.255.255.0</span>
	<b>Default Gateway</b> <span style="float: right;">10.10.10.254</span>
	<span>Cancel</span> <span>&lt;&lt; Back</span> <span>Next &gt;&gt;</span>

If the Static IP be selected, user have to set up the IP address, subnet mask and default gateway according to the ISP that provided the related information.

**IP Address:** Enter the WAN IP address provided by your ISP here.

**Subnet Mask:** Enter the subnet mask here.

**Default Gateway:** Enter the default gateway IP address provided by your ISP here.

#### DHCP (Auto Config)

WAN Connection Type

If the DHCP(Auto Config) be selected, the PC will obtain the IP address automatically.

#### PPPoE (ADSL)

WAN Connection Type

User Name

Password

If the PPPoE (ADSL) be selected, user have to set up the user name and password according to the ISP that provided the related information.

**User Name:** Enter the username that provide by your ISP provider. Maximum input is 32 alphanumeric characters (case sensitive).

**Password:** Enter the password that provide by your ISP provider. Maximum input is 32 alphanumeric characters (case-sensitive).

#### 3G (DIAL)

WAN Connection Type

Provider

Service Name

Dial Number

Operation Mode

Keep Alive Mode: Redial Period  seconds

On demand Mode: Idle Time  minutes

MTU value:

User have to insert USB card therefore, the 3G(DIAL) function can be used.

**Provider:** Select the ISP (Telecommunications) that provide the USB card from the pull-down list.

**Service Name:** Enter the service name that the ISP provided.

	<p><b>Dial Number:</b> Enter the dial number that the ISP provided.</p> <p><b>Operation Mode:</b> Select <b>Keep Alive</b>, <b>On Demand</b> or <b>Manual</b> form the pull-down list.</p> <ul style="list-style-type: none"> <li>● Keep Alive Mode: Enter the Redial Period seconds in the box.</li> <li>● On demand Mode: Enter the Idle Time minutes in the box.</li> <li>● MTU Value: MTU (Maximum Transmission Unit, namely the maximum packet size, the default value is 1452) for your application. Reducing the packet size can help connecting to certain web sites or speeding up packet transfer rate. If the incorrect selection is entered, you may not be able to open certain web sites.</li> </ul>
--	--

## Step 3- LAN

This step can set up local area network of the Wireless Router, such as IP address, subnet mask, DHCP type, DHCP IP addresses range, DHCP subnet mask and DHCP lease time.

<b>IP Address</b>	<input type="text" value="192.168.1.1"/>
<b>Subnet Mask</b>	<input type="text" value="255.255.255.0"/>
<b>DHCP Type</b>	Server <input type="button" value="v"/>
<b>Start IP Address</b>	<input type="text" value="192.168.1.100"/>
<b>End IP Address</b>	<input type="text" value="192.168.1.200"/>
<b>Subnet Mask</b>	<input type="text" value="255.255.255.0"/>
<b>Primary DNS Server</b>	<input type="text" value="192.168.1.1"/>
<b>Secondary DNS Server</b>	<input type="text" value="0.0.0.0"/>
<b>Default Gateway</b>	<input type="text" value="192.168.1.1"/>
<b>Lease Time</b>	<input type="text" value="86400"/> seconds
<input type="button" value="Cancel"/> <input type="button" value=" &lt;&lt; Back"/> <input type="button" value=" Next &gt;&gt;"/>	

<b>IP Address</b>	Shows the IP address of the Wireless Router (Default IP address is 192.168.1.1.)
<b>Subnet Mask</b>	The subnet mask of the Wireless Router (Default subnet mask is 255.255.255.0.)
<b>DHCP Type</b>	<p><b>Disable:</b> Select to disable this Wireless Router to distribute IP addresses to connected clients.</p> <p><b>Server:</b> Select to enable this Wireless Router to distribute IP Addresses (DHCP Server) to connected clients. And the following field will be activated for you to enter the starting IP Address.</p>
<b>Start IP Address</b>	The starting address of this local IP network address pool. The pool is a piece of continuous IP address segment. Keep the default value

	192.168.1.100 should work for most cases.
<b>End IP Address</b>	The end IP address, the maximum is 254. If “ <b>Start IP Address</b> ” is set at 192.168.1.100 and the “ <b>End IP address</b> ” is 192.168.1.200, the device will distribute IP addresses from 192.168.1.100 to 192.168.1.200 to all the computers in the network that request IP addresses from DHCP server (Router).
<b>Subnet Mask</b>	The subnet mask of the distribute IP addresses clients, the subnet mask must be set at the same segment as the Wireless Router.
<b>Primary DNS Server</b> <b>Secondary DNS Server</b>	The <i>DNS</i> should be set to the address provided by your ISP.
<b>Default Gateway</b>	Enter the default gateway IP address provided by your ISP in this column.
<b>Lease Time</b>	The lease time of the distribute IP Addresses. Default settings are 86400 seconds.

## Step 4- Network Mode

This step can set up wireless network mode, network name and channel.

**Network Mode** 11b/g/n mixed mode ▼

**Network Name(SSID)** 3G\_Router

**Frequency (Channel)** AutoSelect ▼

Cancel << Back Next >>

<b>Network Mode</b>	Select 11b/g mixed mode, 11b only, 11g only, or 11b/g/n mixed mode from the pull-down menu. (Default is 11b/g/n mixed mode.)
<b>Network Name (SSID)</b>	A SSID is referred to a network name because essentially it is a name (case-sensitive) that identifies a wireless network.
<b>Frequency (Channel)</b>	Select 1~11 or Auto Select from the pull-down menu.

## Step 5- Security

Here can set up the wireless security of the Wireless Router.

**Security Mode** Disable ▼

Cancel << Back Finished

## Security Mode

Select desired security type from the pull-down menu **Disable, Open System, Shared Key, AUTO(Open/Shared), WPA-PSK, WPA2-PSK, and WPA-PSK/WPA2-PSK**. The default setting is Disable. It is strongly recommended to set up security mode (Open, Shared, AUTO(Open/Shared), WPA-PSK, WPA2-PSK, WPA-PSK/WPA2-PSK) to prevent any unauthorized accessing.

### Open System/Shared Key/AUTO(Open/Shared)

Security Mode	Open System		▼	
Default Key	Key2		▼	
WEP Key 1	<input type="text"/>	Hex	▼	
WEP Key 2	<input type="text"/>	Hex	▼	
WEP Key 3	<input type="text"/>	Hex	▼	
WEP Key 4	<input type="text"/>	Hex	▼	
		Cancel	<< Back	Finished

**Default Key:** Select the default key Key 1~4.

**WEP Key 1~4:** Enter the key in the selected key field. Only valid when using WEP encryption algorithm. The key must match with the AP's key. There are several formats to enter the keys.

- **Hexadecimal (WEP 64 bits):** 10 Hex characters (0~9, a~f).
- **Hexadecimal (WEP 128 bits):** 26 Hex characters (0~9, a~f).
- **ASCII (WEP 64 bits):** 5 ASCII characters (case-sensitive).
- **ASCII (WEP 128 bits):** 13 ASCII characters (case-sensitive).

### WPA-PSK/ WPA2-PSK/ WPA-PSK/WPA2-PSK

Security Mode	WPA-PSK/WPA2-PSK		▼	
WPA Algorithms	<input type="radio"/> TKIP <input checked="" type="radio"/> AES <input type="radio"/> TKIP/AES			
Pass Phrase	<input type="text" value="12345678"/>			
		Cancel	<< Back	Finished

**WPA Algorithms:** Select the type of algorithm, TKIP or AES for WP-PSK; and TKIP, AES or TKIP/AES for WPA2-PSK, WPA-PSK/WPA2- PSK.

**Pass Phrase:** Enter the pass phrase 8~63 ASCII or 64 hexadecimal characters in the column.

# Internet

## LAN Interface Setup

### Local Area Network (LAN) Settings

You may enable/disable networking functions and configure their parameters as your wish.

#### LAN Setup

IP Address	<input type="text" value="192.168.1.1"/>
Subnet Mask	<input type="text" value="255.255.255.0"/>
MAC Address	00:0C:43:41:41:C7
DHCP Type	Server <input type="button" value="v"/>
Start IP Address	<input type="text" value="192.168.1.100"/>
End IP Address	<input type="text" value="192.168.1.200"/>
DHCP Primary DNS	<input type="text" value="192.168.1.1"/>
DHCP Secondary DNS	<input type="text" value="0.0.0.0"/>
Lease Time(sec)	<input type="text" value="86400"/>
Statically Assigned	MAC: <input type="text" value="00:00:00:00:00:00"/> IP: <input type="text" value="0.0.0.0"/>
Statically Assigned	MAC: <input type="text" value="00:00:00:00:00:00"/> IP: <input type="text" value="0.0.0.0"/>
Statically Assigned	MAC: <input type="text" value="00:00:00:00:00:00"/> IP: <input type="text" value="0.0.0.0"/>
UPNP	Enable <input type="button" value="v"/>
PPPoE Relay	Disable <input type="button" value="v"/>
DNS Proxy	Enable <input type="button" value="v"/>

IP Address	Shows the IP address of the Wireless Router (Default IP address is 192.168.1.1)
Subnet Mask	The subnet mask of the Wireless Router (Default subnet mask is 255.255.255.0.)
MAC Address	Shows the MAC address of this Wireless Router.
DHCP Type	<b>Disable:</b> Select to disable this Wireless Router to distribute IP addresses to connected clients.

	<b>Server:</b> Select to enable this Wireless Router to distribute IP Addresses (DHCP Server) to connected clients. And the following field will be activated for you to enter the starting IP Address.
<b>Start IP Address</b>	The starting address of this local IP network address pool. The pool is a piece of continuous IP address segment. Keep the default value 192.168.1.100 should work for most cases.
<b>End IP address</b>	The end IP address, the maximum is 254. If “ <b>Start IP Address</b> ” is set at 192.168.1.100 and the “ <b>End IP address</b> ” is 192.168.1.200, the device will distribute IP addresses from 192.168.1.100 to 192.168.1.200 to all the computers in the network that request IP addresses from DHCP server (Router).
<b>Subnet Mask</b>	The subnet mask of the distribute IP addresses clients, the subnet mask must be set at the same segment as the Wireless Router.
<b>DHCP Primary DNS Server</b>	You can specify your own preferred DNS server IP address(es).
<b>DHCP Secondary DNS Server</b>	Secondary DNS Server is optional. You can enter another DNS server’s IP address as a backup.
<b>Default Gateway</b>	Shows the default gateway IP address.
<b>Lease Time</b>	The lease time of the distribute IP Addresses. Default settings are 86400 seconds.
<b>Statically Assigned</b>	<b>MAC:</b> Enter the MAC address of a certain station, and then the DHCP Server will to distribute a fixed IP address to the station automatically once be connected. <b>IP:</b> Enter the fixed IP address that DHCP Server assigned to a certain connected station. User can set up 3 set of fixed IP addresses that distribute form the Wireless Router when the DHCP Type function be selected to Server.
<b>UPnP</b>	Universal Plug and Play (UPnP) is a set of computer protocols promulgated by the UPnP Forum. The goals of UPnP are to allow devices to connect seamlessly and to simplify the implementation of networks in the home (data sharing, communications, and entertainment) and in corporate environments for simplified installation of computer components. UPnP achieves this by defining and publishing UPnP device control protocols built upon open, Internet-based communication standards. The term UPnP is derived from plug-and-play, a technology for dynamically attaching devices directly to a computer.  Select Disable or Enable from the pull-down menu.
<b>PPPoE Relay</b>	Select Disable or Enable from the pull-down menu.
<b>DNS Proxy</b>	Select Disable or Enable from the pull-down menu.
<b>Apply</b>	After completing the settings on this page, click <b>Apply</b> button to save the settings.
<b>Cancel</b>	Click <b>Cancel</b> to restore to default values.

# Internet Service Setup

## Wide Area Network (WAN) Settings

You may choose different connection type suitable for your environment. Besides, you may also configure parameters according to the selected connection type.

**WAN Connection Type** DHCP (Auto Config) ▼

**DHCP Mode**

**Hostname(optional)**

**MAC Address Clone**

**MAC Address Clone** Disable ▼

### WAN Connection Type

Select the WAN Connection Type **Static (Fixed IP)**, **DHCP (Auto Config)**, **PPPoE(ADSL)**, or **3G (DIAL)**. Default setting is **DHCP (Auto Config)** enabled.

#### DHCP (Auto Config)

**WAN Connection Type** DHCP (Auto Config) ▼

**DHCP Mode**

**Hostname(optional)**

If the DHCP(Auto Config) be selected, the PC will obtain the IP address automatically.

**Hostname(optional):** Enter the hostname that assigned IP address to user's computer in this field. Maximum input is 32 alphanumeric characters (case sensitive).

#### Static (Fixed IP)

**WAN Connection Type** Static (Fixed IP) ▼

**Static Mode**

<b>IP Address</b>	<input type="text" value="10.0.2.225"/>
<b>Subnet Mask</b>	<input type="text" value="255.0.0.0"/>
<b>Default Gateway</b>	<input type="text" value="10.0.0.252"/>
<b>Internet Primary DNS</b>	<input type="text" value="10.0.0.6"/>
<b>Internet Secondary DNS</b>	<input type="text" value="168.95.1.1"/>

If the Static (fixed IP) be selected, user have to set up the IP address, subnet mask and default gateway according to the ISP that provided the related information.

**IP Address:** Enter the WAN IP address provided by your ISP here.

**Subnet Mask:** Enter the subnet mask here.

**Default Gateway:** Enter the default gateway IP address provided by your ISP

here.

**Primary DNS Server:** Enter the DNS server IP address(es) that provided by your ISP, or you can specify your own preferred DNS server IP address(es).

**Secondary DNS Server:** Secondary DNS Server is optional. You can enter another DNS server's IP address as a backup.

MTU Value

Auth Mode PAP ▾

If the PPPoE (ADSL) be selected, user have to set up the user name and password according to the ISP that provided the related information.

**User Name:** Enter the username that provide by your ISP provider.

Maximum input is 32 alphanumeric characters (case sensitive).

**Password:** Enter the password that provide by your ISP provider. Maximum input is 32 alphanumeric characters (case-sensitive).

**Verify Password:** Enter the password again to confirm.

**MTU Value:** MTU (Maximum Transmission Unit, namely the maximum packet size, the default value is 1452) for your application. Reducing the packet size can help connecting to certain web sites or speeding up packet transfer rate. If the incorrect selection is entered, you may not be able to open certain web sites.

**Auth Mode:** Select the authentication mode form the pull-down list.

## DHCP Clients

Here shows the IP assigned clients that computer in the network requests IP addresses from DHCP server (Wireless Router).

DHCP Client List		
You could monitor DHCP clients here.		
DHCP Clients		
MAC Address	IP Address	Expires In
00:00:00:00:00:00	192.168.1.100	00:59:41
00:12:0E:9A:A1:D9	192.168.1.101	23:59:44

# Advanced Routing

If you connect several routers with this Wireless Router, you may need to set up a predefined routing rule to have more effective network topology/traffic, this is called static route between those routers and the Wireless Router.

To set static routers, enter the settings including route IP address, route mask route gateway the route Interface from LAN or WAN.

## Static Routing Settings

You may add and remote custom Internet routing rules, and/or enable dynamic routing exchange protocol here.

### Add a routing rule

**Destination**   
**Range**   
**Gateway**   
**Interface**    
**Comment**

### Current Routing Table In The System

No.	Destination	Netmask	Gateway	Flags	Metric	Ref	Use	Interface	Comment
1	255.255.255.255	255.255.255.255	0.0.0.0	5	0	0	0	LAN(br0)	
2	192.168.1.0	255.255.255.0	0.0.0.0	1	0	0	0	LAN(br0)	
3	239.0.0.0	255.0.0.0	0.0.0.0	1	0	0	0	LAN(br0)	
4	10.0.0.0	255.0.0.0	0.0.0.0	1	0	0	0	WAN (eth2.2)	
5	0.0.0.0	0.0.0.0	10.0.0.252	3	0	0	0	WAN (eth2.2)	

<b>Destination</b>	The network address of the destination LAN segment. When a packet with destination IP address that matches to this field, it will route to the device set in the Route Gateway field.
<b>Range</b>	Select Host or Net from the pull-down menu.
<b>Gateway</b>	Enter the Gateway IP address in the field.
<b>Interface</b>	You can select to use LAN, WAN or Custom as the physical interface from where the packets will be sent.
<b>Comment</b>	Enter note or remark here.
<b>Dynamic Routing Settings</b>	Select Disable or Enable form pull-down list to use the RIP function.
<b>Apply</b>	After completing the settings on this page, click <b>Apply</b> button to save the settings.
<b>Reset</b>	Click to discard current setting.

# VPN Pass Through

## Wireless Security/Encryption Settings

SSID Choice

Select SSID to set up the security form the pull-down list.

Security Mode

There are eleven type of authentication modes including **Disable, Open System, Shared Key, AUTO(Open/Shared), WPA, WPA-PSK, WPA2, WPA2-PSK, WPA-PSK/ WPA2-PSK, WPA1/WPA2 and 802.1X**. The security default setting is Disable.

**Note:**

- WPA and WPA-PSK only support TKIP and AES as encryption method.
- Shared Key only supports WEP as encryption method.
- AUTO(Open/Shared) means AP can accept STA connect to it using OPEN-WEP or SHARED-WEP.

**Open System/AUTO(Open/Shared)**

If your wireless router is using **Open System** or **AUTO(Open/Shared)** authentication, then the wireless adapter will need to be set to the same authentication type.

"Cherry"

Security Mode AUTO(Open/Shared) ▾

Wire Equivalence Protection (WEP)

Default Key Key 1 ▾

WEP Key should be a 10/26 hexadecimal or a 5/13 character.

WEP Key 1	<input type="text"/>	Hex ▾
WEP Key 2	<input type="text"/>	Hex ▾
WEP Key 3	<input type="text"/>	Hex ▾
WEP Key 4	<input type="text"/>	Hex ▾

- Default Key:** Select the default key.  
**WEP Key 1~4:** Enter the key in the selected key field. Only valid when using WEP encryption algorithm. The key must match with the AP's key. There are several formats to enter the keys.
- **Hexadecimal (WEP 64 bits):** 10 Hex characters (0~9, a~f).
  - **Hexadecimal (WEP 128 bits):** 26 Hex characters (0~9, a~f).
  - **ASCII (WEP 64 bits):** 5 ASCII characters (case-sensitive).
  - **ASCII (WEP 128 bits):** 13 ASCII characters (case-sensitive).

**Shared Key**

Shared key is when both the sender and the recipient share a secret key.

**Session Timeout:** Session timeout interval is for 802.1x re-authentication setting. Set to zero to disable 802.1x re-authentication service for each session. Session timeout interval unit is second and must be larger than 60.

**Idle Timeout:** Enter the idle timeout in the column.

Access Policy	
<b>Policy</b>	Set access control policy of the stations. Select Disable, Allow or Reject form the pull-down menu.
<b>Add a station Mac</b>	Enter a station MAC in the blank field. The maximum rule count is 8.

## WDS

Making a connection between access points by using WDS function, please follow below steps.

1. The APs must support WDS function.  
(To set WDS must use the same **wireless product** (the same **model** will be better); due to different wireless products might support different WDS settings. Thus, it is suggested to use the same wireless products that support WDS function.)
2. To set the same **SSID** on the APs.
3. To set the same **channel** on the APs.
4. To set the same **Wireless MAC address(BSSID)** on the APs.
5. To set same **security** (WEP or WPA) on the APs.

Wireless Distribution System

Select Disable or Enable from the pull-down list. Default setting is Disable.

#### Stateful Packet Inspection (SPI)

**SPI Firewall**

Stateful packet inspection (SPI) is a firewall that keeps track of the state of network connections (such as TCP streams, UDP communication) traveling across it. The firewall is programmed to distinguish legitimate packets for different types of connections. Only packets matching a known connection state will be allowed by the firewall; others will be rejected.

Select Disable or Enable the SPI firewall function from the pull-down list. Default setting is Disable.

# URL Filtering Settings

## URL Filter Settings

You can setup Webs URL Filter to restrict the improper content access.

### Basic Settings

**Webs URL Filtering**

Disable ▾

Account

Password

DDNS

Result

Administrator Settings	
Account	Key in a new login user name in the blank field.
Password	Maximum input is 36 alphanumeric characters (case-sensitive.)
NTP Settings	
Current Time	Click <b>Sync with host</b> button to synchronize the time with the host PC.
Time Zone	Select the time zone area that you located from the pull-down list.
NTP Server	Enter the Network Time Protocol Server here. Ex: time.nist.gov, ntp0.broad.mit.edu, or time.stdtime.gov.tw.
NTP synchronization	The device will synchronize time with the server according to the hour(s) that entered.
Green AP	
Duration	After the Action (WiFi TX power) be enabled, then the duration time can be set up. Set up a period of time to enable or disable the wireless TX function.
Action	Select Disable, WiFi TX power OFF, WiFi TX power 25%, WiFi TX power 50%, or WiFi TX power 75% from the pull-down menu, to enable or disable the wireless TX function of the Wireless Router.
DDNS Settings	
Dynamic DNS Provider	Select the DNS provider form the pull-down list. DNS provider is a company that provides access to the internet.
Account	Enter your account that registered in DNS provider website.
Password	Enter passwords that registered.
DDNS	Apply for a Domain Name, and ensure it is allocated to you.
Result	Here shows the DDNS status.

## Upload Firmware

### Upgrade Firmware

Upgrade the system firmware to obtain new functionality.

### Update Firmware

Location

Browse...

Apply

### Update Firmware

Location

Click the **Browse...** button, find and open the firmware file (the browser will display to correct file path) then click **Apply** to upgrade the Wireless Router's firmware.

#### Notice!

**Please DO NOT power OFF the Wireless Router while upgrading firmware.**

# Settings Management

## Settings Management

You might save system settings by exporting them to a configuration file, restore them by importing the file, or reset them to factory default.

### Export Settings

Export Settings

Export

### Import Settings

Reboot

# Chapter 4: PC Configuration

## Overview

For each PC, the following may need to be configured:

- TCP/IP network settings
- Internet Access configuration
- Wireless configuration

## Windows Clients

- This section describes how to configure Windows clients for Internet access via the Wireless Router.
- The first step is to check the PC's TCP/IP settings.
- The Wireless Router uses the TCP/IP network protocol for all functions, so it is essential that the TCP/IP protocol be installed and configured on each PC.

## TCP/IP Settings - Overview

If using default Wireless Router settings, and default Windows TCP/IP settings, no changes need to be made.

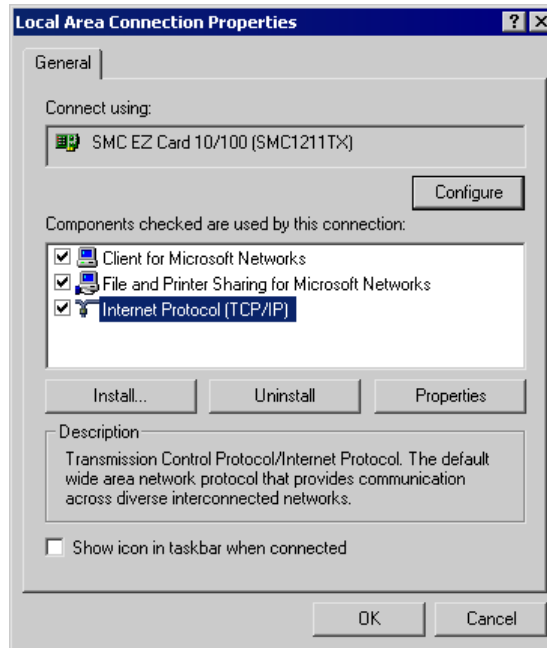

- By default, the Wireless Router will act as a DHCP Server, automatically providing a suitable IP Address (and related information) to each PC when the PC boots.
- For all non-Server versions of Windows, the default TCP/IP setting is to act as a DHCP client.

If using a Fixed (specified) IP address, the following changes are required:

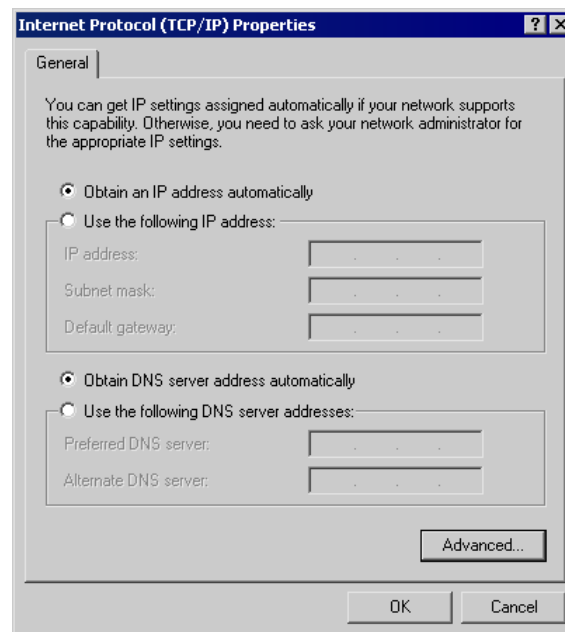

- The *Gateway* must be set to the IP address of the Wireless Router.
- The *DNS* should be set to the address provided by your ISP.

## Checking TCP/IP Settings - Windows 2000

1. Select Control Panel - Network and Dial-up Connection.
2. Right - click the *Local Area Connection* icon and select *Properties*. You should see a screen like the following:

3. Select the *TCP/IP* protocol for your network card.
4. Click on the *Properties* button. You should then see a screen like the following.

5. Ensure your TCP/IP settings are correct, as described below.

### Using DHCP

- To use DHCP, select the radio button *Obtain an IP Address automatically*. This is the default Windows setting. Using this is recommended. By default, the Wireless Router will act as a DHCP Server.
- Restart your PC to ensure it obtains an IP Address from the Wireless Router.

### Using a fixed IP Address ("Use the following IP Address")

If your PC is already configured, check with your network administrator before making the following changes.

- Enter the Wireless Router's IP address in the *Default gateway* field and click *OK*. (Your LAN administrator can advise you of the IP Address they assigned to the Wireless Router.)

- If the *DNS Server* fields are empty, select *Use the following DNS server addresses*, and enters the DNS address or addresses provided by your ISP, then click *OK*.

## Checking TCP/IP Settings - Windows XP

1. Select Control Panel - Network Connection.
2. Right click the *Local Area Connection* and choose *Properties*. You should see a screen like the following:

3. Select the *TCP/IP* protocol for your network card.
4. Click on the *Properties* button. You should then see a screen like the following.

5. Ensure your TCP/IP settings are correct.

## Using DHCP

- To use DHCP, select the radio button *Obtain an IP Address automatically*. This is the default Windows setting. Using this is recommended. By default, the Wireless Router will act as a DHCP Server.
- Restart your PC to ensure it obtains an IP Address from the Wireless Router.

## Using a fixed IP Address ("Use the following IP Address")

If your PC is already configured, check with your network administrator before making the following changes.

- In the *Default gateway* field, enter the Wireless Router's IP address and click *OK*. Your LAN administrator can advise you of the IP Address they assigned to the Wireless Router.
- If the *DNS Server* fields are empty, select *Use the following DNS server addresses*, and enter the DNS address or addresses provided by your ISP, then click *OK*.

## Internet Access

To configure your PCs to use the Wireless Router for Internet access:

- Ensure that the ADSL modem, DSL modem, Cable modem, or other permanent connection is functional.
- Use the following procedure to configure your Browser to access the Internet via the LAN, rather than by a Dial-up connection.

### For Windows 2000

1. Select Start Menu - Settings - Control Panel - Internet Options.
2. Select the Connection tab, and click the *Setup* button.
3. Select "I want to set up my Internet connection manually, or I want to connect through a local area network (LAN)" and click *Next*.
4. Select "I connect through a local area network (LAN)" and click *Next*.
5. Ensure all of the boxes on the following Local area network Internet Configuration screen are unchecked.
6. Check the "No" option when prompted "Do you want to set up an Internet mail account now?"
7. Click *Finish* to close the Internet Connection Wizard. Setup is now completed.

### For Windows XP

1. Select Start Menu - Control Panel - Network and Internet Connections.
2. Select *Set up or change your Internet Connection*.
3. Select the *Connection* tab, and click the *Setup* button.
4. Cancel the pop-up "Location Information" screen.
5. Click *Next* on the "New Connection Wizard" screen.
6. Select "Connect to the Internet" and click *Next*.
7. Select "Set up my connection manually" and click *Next*.
8. Check "Connect using a broadband connection that is always on" and click *Next*.
9. Click *Finish* to close the New Connection Wizard. Setup is now completed.

## Accessing AOL

To access AOL (America On Line) through the Wireless Router, the *AOL for Windows* software must be configured to use TCP/IP network access, rather than a dial-up connection. The configuration process is as follows:

1. Start the *AOL for Windows* communication software. Ensure that it is Version 2.5, 3.0 or later. This procedure will not work with earlier versions.
2. Click the *Setup* button.
3. Select *Create Location*, and change the location name from "New Locality" to "Wireless Router".
4. Click *Edit Location*. Select *TCP/IP* for the *Network* field. (Leave the *Phone Number* blank.)
5. Click *Save*, then *OK*.
6. Configuration is now complete.
7. Before clicking "Sign On", always ensure that you are using the "Wireless Router" location.

## Macintosh Clients

From your Macintosh, you can access the Internet via the Wireless Router. The procedure is as follows.

1. Open the TCP/IP Control Panel.
2. Select *Ethernet* from the *Connect via* pop-up menu.
3. Select *Using DHCP Server* from the *Configure* pop-up menu. The DHCP Client ID field can be left blank.
4. Close the TCP/IP panel, saving your settings.

### **Note:**

If using manually assigned IP addresses instead of DHCP, the required changes are:

- Set the *Router Address* field to the Wireless Router 's IP Address.
- Ensure your DNS settings are correct.

## Linux Clients

To access the Internet via the Wireless Router, it is only necessary to set the Wireless Router as the "Gateway".

Ensure you are logged in as "root" before attempting any changes.

### **Fixed IP Address**

By default, most Unix installations use a fixed IP Address. If you wish to continue using a fixed IP Address, make the following changes to your configuration.

- Set your "Default Gateway" to the IP Address of the Wireless Router.
- Ensure your DNS (Domain Name server) settings are correct.

### **To act as a DHCP Client (Recommended)**

The procedure below may vary according to your version of Linux and X -windows shell.

1. Start your X Windows client.
2. Select *Control Panel – Network*.
3. Select the "Interface" entry for your Network card. Normally, this will be called "eth0".
4. Click the *Edit* button, set the "protocol" to "DHCP", and save this data.
5. To apply your changes:
  - Use the "Deactivate" and "Activate" buttons, if available.

- OR, restart your system.

## Other Unix Systems

To access the Internet via the Wireless Router:

- Ensure the "Gateway" field for your network card is set to the IP Address of the Wireless Router.
- Ensure your DNS (Name Server) settings are correct.

## Wireless Station Configuration

- This section applies to all wireless stations wishing to use the Wireless Router 's access point, regardless of the operating system that is used on the client.
- To use the Wireless Router, each wireless station must have compatible settings, as following:

<b>Mode</b>	The mode must be set to <i>Infrastructure</i> .
<b>SSID (ESSID)</b>	The network name must match the value used on the Wireless Router. <i>Note! The SSID is case sensitive.</i>
<b>Open System Shared Key</b>	If there is no security is enabled on the Wireless Router, the security of each station should be disabled as well. And, you can connect the Wireless Router without security, but it is NOT recommended.
<b>AUTO(Open/Shared)</b>	By default, WEP on the Wireless Router is disabled. <ul style="list-style-type: none"> <li>• If WEP remains disabled on the Wireless Router, all stations must have WEP disabled.</li> <li>• If WEP is enabled on the Wireless Router, each station must use the same settings as the Wireless Router.</li> </ul>
<b>WPA-PSK WPA2-PSK WPA-PSK WPA2-PSK</b>	WPA-PSK (TKIP/AES)/ WPA2-PSK (TKIP/AES)/ WPA-RADIUS (TKIP/AES)/ WPA2 -RADIUS (TKIP/AES): If one of these securities is enabled on the Wireless Router. To make a connection, each station must use the same algorithms and pass phrase as the Wireless Router.
<b>WPA WPA2 WPA WPA2 802.1x</b>	RADIUS Server: RADIUS is an authentication, authorization and accounting client-server protocol. The client is a Network Access Server that desires to authenticate its links. The server is a server that has access to a user database with authentication information. Each station must set up the RADIUS Server's IP address, port and passwords that provided by your ISP.

**Note:** By default, the Wireless Router will allow 802.11b, 802.11g and 802.11n connections.

# Appendix A: Troubleshooting

## Overview

This chapter covers some common problems that may be encountered while using the Wireless Router and some possible solutions to them. If you follow the suggested steps and the Wireless Router still does not function properly, contact your dealer for further advice.

## General Problems

<b>Problem 1:</b>	Can't connect to the Wireless Router to configure it.
<b>Solution 1:</b>	<p>Check the following:</p> <ul style="list-style-type: none"><li>• Check the Wireless Router is properly installed, LAN connections are OK, and it is powered ON.</li><li>• Ensure that your PC and the Wireless Router are on the same network segment.</li><li>• If your PC is set to "Obtain an IP Address automatically" (DHCP client), please restart it.</li><li>• If your PC uses a Fixed (Static) IP address, ensure that it is using an IP Address within the range 192.168.1.2 to 192.168.1.254 and thus compatible with the Wireless Router's default IP Address of 192.168.1.1. Also, the Network Mask should be set to 255.255.255.0 to match the Wireless Router.</li></ul> <p>In Windows, you can check these settings by using <i>Control Panel-Network</i> to check the <i>Properties</i> for the TCP/IP protocol.</p>

## Internet Access

<b>Problem 1:</b>	When I enter a URL or IP address I get a time out error.
<b>Solution 1:</b>	<p>A number of things could be causing this. Try the following troubleshooting steps.</p> <ul style="list-style-type: none"><li>• Check if other PCs work. If they do, ensure that your PCs IP settings are correct. If using a Fixed (Static) IP Address, check the Network Mask, Default gateway and DNS as well as the IP Address.</li><li>• If the PCs are configured correctly, but still not working, check the Wireless Router. Ensure that it is connected and ON. Connect to it and check its settings. (If you can't connect to it, check the LAN and power connections.)</li></ul>

	<ul style="list-style-type: none"> <li>● If the Wireless Router is configured correctly, check your Internet connection (DSL/Cable modem etc) to see that it is working correctly.</li> </ul>
<b>Problem 2:</b>	Some applications do not run properly when using the Wireless Router.
<b>Solution 2:</b>	<p>The Wireless Router processes the data passing through it, so it is not transparent. Use the <i>Content Filter Settings</i> feature to allow the use of Internet applications, which do not function correctly.</p> <p>If this does solve the problem you can use the <i>DMZ</i> function. This should work with almost every application, but:</p> <ul style="list-style-type: none"> <li>● It is a security risk, since the firewall is disabled.</li> <li>● Only one (1) PC can use this feature.</li> </ul>

## Wireless Access

<b>Problem 1:</b>	My PC can't locate the Wireless Router.
<b>Solution 1:</b>	<p>Check the following:</p> <ul style="list-style-type: none"> <li>● Your PC is set to <i>Infrastructure Mode</i>. (Access Points are always in <i>Infrastructure Mode</i>)</li> <li>● The SSID on your PC and the Wireless Router are the same. Remember that the SSID is case-sensitive. So, for example "<u>W</u>orkgroup" does NOT match "<u>w</u>orkgroup."</li> <li>● Both your PC and the Wireless Router must have the same setting for security. The default setting for the Wireless Router security is disabled, so your wireless station should also have security disabled.</li> <li>● If security is enabled on the Wireless Router, your PC must have security enabled, and the key must be matched.</li> <li>● To see if radio interference is causing a problem, see if connection is possible when close to the Wireless Router. Remember that the connection range can be as little as 100 feet in poor environments.</li> </ul>
<b>Problem 2:</b>	Wireless connection speed is very slow.
<b>Solution 2:</b>	<p>The wireless system will connect at the highest possible speed, depending on the distance and the environment. To obtain the highest possible connection speed, you can experiment with the following:</p> <ul style="list-style-type: none"> <li>● Wireless Router location Try adjusting the location and orientation of the Wireless Router.</li> <li>● Wireless Channel If interference is the problem, changing to another channel may show a marked improvement.</li> <li>● Radio Interference Other devices may be causing interference. You can experiment by switching other devices off, and see if this helps. Any "noisy" devices should be shielded or relocated.</li> </ul>

	<ul style="list-style-type: none"><li>● RF Shielding Your environment may tend to block transmission between the wireless stations. This will mean high access speed is only possible when close to the Wireless Router.</li></ul>
--	--

# Appendix B: About Wireless LANs

## BSS

### BSS

A group of Wireless Stations and a single Access Point, all using the same ID (SSID), form a Basic Service Set (BSS).

Using the same SSID is essential. Devices with different SSIDs are unable to communicate with each other.

## Channels

The Wireless Channel sets the radio frequency used for communication.

- Access Points use a fixed Channel. You can select the Channel used. This allows you to choose a Channel which provides the least interference and best performance. In the USA and Canada, 11 channels are available. If using multiple Access Points, it is better if adjacent Access Points use different Channels to reduce interference.
- In "Infrastructure" mode, Wireless Stations normally scan all Channels, looking for an Access Point. If more than one Access Point can be used, the one with the strongest signal is used. (This can only happen within an ESS.)

**Note to US model owner: To comply with US FCC regulation, the country selection function has been completely removed from all US models. The above function is for non-US models only.**

## Security

### WEP

WEP (Wired Equivalent Privacy) is a standard for encrypting data before it is transmitted. This is desirable because it is impossible to prevent snoopers from receiving any data which is transmitted by your Wireless Stations. But if the data is encrypted, then it is meaningless unless the receiver can decrypt it.

**If WEP is used, the Wireless Stations and the Access Point must have the same security settings for each of the following:**

<b>WEP</b>	64 Bits, 128 Bits.
<b>Key</b>	For 64 Bits encryption, the Key value must match. For 128 Bits encryption, the Key value must match.
<b>WEP Authentication</b>	Open System or Shared Key.

## WPA/WPA2

WPA/WPA2 (Wi-Fi Protected Access) is more secure than WEP. It uses a “Shared Key” which allows the encryption keys to be regenerated at a specified interval. There are several encryption options: **TKIP, AES, TKIP-AES** and additional setup for **RADIUS** is required in this method. The most important features beyond WPA to become standardized through 802.11i/WPA2 are: pre-authentication, which enables secure fast roaming without noticeable signal latency.

**If WPA or WPA2 is used, the Wireless Stations and the Access Point must have the same security settings.**

## WPA-PSK/ WPA2-PSK

WPA/WPA2 (Wi-Fi Protected Access using Pre-Shared Key) is recommended for users who are not using a RADIUS server in a home environment and all their clients support WPA/WPA2. This method provides a better security.

**If WPA-PSK or WPA2-PSK is used, the Wireless Stations and the Access Point must have the same security settings.**

Encryption	WEP Key 1~4	Passphrase
TKIP	NOT REQUIRED	8-63 characters
AES		

## 802.1x

With **802.1x** authentication, a wireless PC can join any network and receive any messages that are not encrypted, however, additional setup for **RADIUS** to issue the WEP key dynamically will be required. RADIUS is an authentication, authorization, and accounting client-server protocol. The client is a Network Access Server that desires to authenticate its links. The server is a server that has access to a user database with authentication information.

# Wireless LAN Configuration

To allow Wireless Stations to use the Access Point, the Wireless Stations and the Access Point must use the same settings, as follows:

<b>Mode</b>	The mode must be set to <i>Infrastructure</i> .
<b>SSID (ESSID)</b>	The network name must match the value used on the Wireless Router. <i>Note! The SSID is case sensitive.</i>
<b>Open System Shared Key</b>	If there is no security is enabled on the Wireless Router, the security of each station should be disabled as well. And, you can connect the Wireless Router without security, but it is NOT recommended.
<b>AUTO(Open/Shared)</b>	By default, WEP on the Wireless Router is disabled. <ul style="list-style-type: none"><li>• If WEP remains disabled on the Wireless Router, all stations must have WEP disabled.</li><li>• If WEP is enabled on the Wireless Router, each station must use the same settings as the Wireless Router.</li></ul>
<b>WPA-PSK WPA2-PSK</b>	WPA-PSK (TKIP/AES)/ WPA2-PSK (TKIP/AES: If one of these

<b>WPA-PSK WPA2-PSK</b>	securities is enabled on the Wireless Router. To make a connection, each station must use the same algorithms and pass phrase as the Wireless Router.
<b>WPA WPA2 WPA WPA2 802.1x</b>	RADIUS Server: RADIUS is an authentication, authorization and accounting client-server protocol. The client is a Network Access Server that desires to authenticate its links. The server is a server that has access to a user database with authentication information. Each station must set up the RADIUS Server's IP address, port and passwords that provided by your ISP.
