# 1 INTRODUCTION

## 1.1 Package Contents

- CradlePoint Compact Broadband Router (CBR400)
- AC power adapter (12V, 1.5A) WARNING: using a power adapter other than the one provided may damage the CBR400 and will void the warranty
- Quick Start Guide

## 1.2 System Requirements

- At least one Internet source: an Ethernet-based modem, a broadband data modem with active subscription (USB, ExpressCard), or WiFi as WAN.
- Windows 2000/XP/7, Mac OS X, or Linux computer (with WiFi adapter—802.11n recommended—for WiFi functionality).
- Internet Explorer v6.0 or higher, Firefox v2.0 or higher, Safari v1.0 or higher.

## 1.3 CBR400 Overview

### FLEXIBLE, RELIABLE, SECURE

The CradlePoint Compact Broadband Router (CBR400) provides advanced support for distributed operations and emerging industries that require flexible, reliable and secure Internet access such as temporary Internet installations, additional network bandwidth or for kiosks, digital signage, and other Machine-to-Machine (M2M) applications.

### FEATURE RICH

The CBR400 is a feature-rich business router in a small package. Built for business applications like travel, mobile workgroups, or stationary remote Internet access, you can rely on CradlePoint's advanced networking features like WiPipe Security, VPN Termination, and Failover/Failback (which protects network uptime in case primary data service fails) - keeping your business online. Standard on the CBR400 are additional security features such as multiple WiFi encryption modes (WEP, WPA, WPA2 Personal and Enterprise) and a built-in firewall, which prevent unauthorized use of your connection.

## EXTENSIVE MODEM SUPPORT

CradlePoint routers are built to work with most popular 4G/3G Modems from: AT&T, Bell Canada, Clearwire, Cricket, Rogers, Sprint, T-Mobile, Telus, US Cellular, Verizon Wireless, & Virgin Mobile (modem and service sold separately).

## ENHANCED WIFI

- 350+ feet of WiFi Range, 2x2 MIMO, two SSIDs
- Wireless “N” WiFi (802.11n + legacy 802.11b/g)
- Supports up to 16 WiFi connections at a time
- 2.4 GHz WiFi broadcast
- Maximum security with both Public and Private networks

## ADDITIONAL FEATURES

- Plug-and-Play support for over 120 broadband data modems, allowing for site-specific carrier/service selection for broadest deployment
- Standardized platform and centralized remote management
- IP passthrough
- Compatible with Cisco, SonicWall, and other VPN termination systems
- Establish continuous uptime with optimum total cost of ownership for broad deployment
- Centralize the administration and monitoring of distributed routers using WiPipe Central
- Simple to install, configure and maintain with minimal impact on IT
- Virtual LAN capabilities
- Data Usage section that allows users to track and manage modem use relative to data plans
- NAT-less routing
- VPN NAT traversal

### 1.3.1 Captive Portal

The Captive Portal solution provided by CradlePoint routers enables businesses to provide their customers with a public WiFi hotspot with access controls. The controls can be as simple as requiring acceptance of a Terms of Service agreement, while Advanced features allow administrators to control and monitor usage, require login, direct users to specific web pages, provide revenue through services fees or paid advertising, and more.

### 1.3.2 WiPipe Central

CradlePoint's cloud-based router management service allows for remote monitoring, configuration, and firmware updates of deployed routers like the CBR400. WiPipe Central drastically simplifies router administration for businesses using multiple routers. WiPipe Central can be purchased separately at <http://cradlepoint.com/support/wipipe-central>.

## 2 HARDWARE OVERVIEW

## 2.1 Ports, Buttons, and Switches

**3G/4G USB Modem Port:** Insert a modem with an active data plan as one possible Internet source.

**Power On/Off:**

- 1 = On
- 0 = Off

**Ethernet Port:** By default, the Ethernet port is configured as a LAN (Local Area Network) port, but it can be reconfigured as a WAN (Wide Area Network—your Internet source) port in **Network Settings → WiFi / Local Networks**. Connect to local devices with the LAN setting, or connect to an Ethernet-based modem with the WAN setting.

**Power 12v DC:** Connect the included power supply to the wall and your CBR400.

**ExpressCard Modem Port:** Insert a modem with an active data plan as one possible Internet source.

**ExpressCard Lock:** Switch to lock an ExpressCard modem in place.

**Factory Default Reset:** You can return your router to factory default settings by pressing and holding the **Reset** button. This button is recessed, so it requires a pointed object such as a paper clip to press. Press and hold for 10 seconds to initiate reset.

**3G/4G Modem Signal Strength Button:** When pressed the bar LEDs indicate signal strength from the USB or ExpressCard modems. The signal strength is shown for 10 seconds if the modem does not support concurrent data connection and signal strength measurement. Tapping this button will toggle the Modem Signal Strength display on and off.

## 2.2 LEDs

### Power:

- Green = Router on
- No light = Router off

### Ethernet:

- Green = Ethernet connected
- Blinking green = Ethernet activity
- No light = Ethernet disconnected or link failure

### WiFi:

- Green = WiFi on and operating normally
- No light = WiFi radio off by administration setting

### USB Status:

- Green = Active data connection
- Blinking green = Connecting
- Blinking amber = Cellular data connection error
- No light = Modem disconnected

**ExpressCard Status:**

- Green = Active data connection
- Blinking green = Connecting
- Blinking amber = Cellular data connection error
- No light = Modem disconnected

**Modem Signal Strength:**

- Green = Active data connection
- Blinking green = Connecting
- Blinking amber = Cellular data connection error
- No light = Modem disconnected

**Modem Signal Strength:** These bars indicate modem signal strength when the signal strength button is momentarily depressed.

**Additional LED Indications:**

Factory reset button detected	WiFi and USB LEDs blink amber twice
Error during USB firmware upgrade	WiFi and USB LEDs blink red

## 3 QUICK START

### 3.1 Basic Setup

- Your router requires an Internet source. Insert a supported USB or ExpressCard modem, connect a Cable or DSL modem to the Ethernet port (this requires a settings change because the Ethernet port is not set as WAN by default; see “Ethernet Port Configuration” in **Network Settings** → **WiFi / Local Networks**), or connect to an available WiFi source (see **Internet** → **WiFi as WAN Settings** to enable WiFi as WAN). For Failover/Failback functionality, you will need at least two of these sources (for example: one Ethernet source and one USB modem).<sup>1</sup>
- Connect the 12v DC power adapter to the router and a power source. Flip the power switch to the ON position; this should illuminate the green Power Status LED.

<sup>1</sup> Data Modem Not Included. This Product Requires an Activated Data Modem or Phone with Data Plan for Full Functionality. See your Cellular/3G/4G Service Provider for Details on Coverage and Data Plan Options

## 3.2 Connect to a Computer or other Device

### 3.2.1 Wireless Network Connection

**1) Find the network.** On a WiFi-enabled computer or device, open the window or dropdown menu that allows you to access wireless networks. The CBR400 network will appear on the list: select this network.

**2) Log in.** You will need to input the **Default Password** when prompted. The Default Password is the last eight digits of the router's MAC address, which can be found on the product box or on the product label on the bottom of the router.

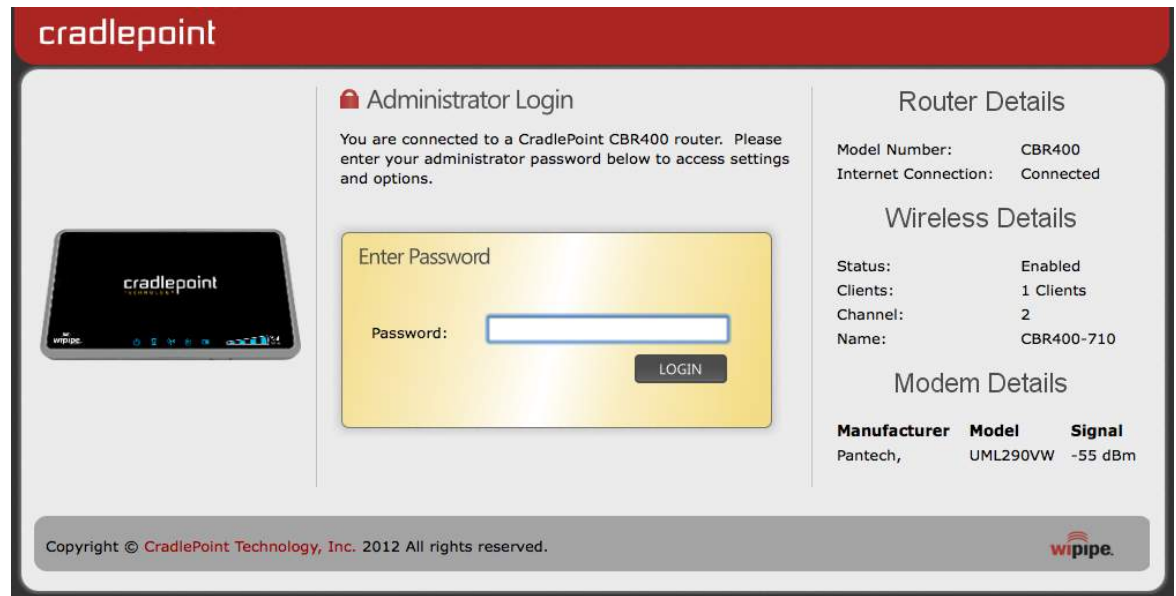

NOTE: If more than one CBR400 wireless router is visible, you can find the correct unit by checking for its **SSID** (service set identifier; the unique name of the local network). The SSID can be found on the bottom of the router in the form CBR400-xxx, where "xxx" is the last 3 digits of the router's MAC address.

### 3.2.2 Accessing the Administration Pages

For most users, the CBR400 Router can be used immediately without any special configuration changes. If you would like to change your network name or password or configure any of the advanced features of the CBR400, you will need to log in to the administration pages:

- Access your router's **Administrator Login** screen by opening a web browser window and typing "[cp/](#)" (your network's default hostname) or the IP address "[192.168.0.1](#)" into the address bar.
- Enter your **Default Password**. This password can be found on the bottom of the CBR400 as the last eight digits of the MAC address. Then click the **LOGIN** button.
- When you log in for the first time, you will be automatically directed to the **First Time Setup Wizard**. Follow the instructions given with the Wizard or see [Getting Started – First Time Setup](#) for more information about using the **First Time Setup Wizard**.

### 3.2.3 Connect to the Internet

If you used the **First Time Setup Wizard**, you might have changed the “WiFi Network Name” or the “Security Mode” password. If so, you will need to reconnect to the CBR400 network.

- **Find the network.** Look for your new personalized network name (or the default SSID of the form “CBR400-xxx”).
- **Log in** using your new personalized WiFi security password (or the Default Password found the bottom of the router as the last eight digits of the MAC address).

Your network should now be up and running, and users who have the security password can access the network on WiFi-enabled devices.

### 3.3 Common Problems

This section contains a list of some of the most common issues faced by users of the CBR400.

Please visit CradlePoint Knowledgebase at <http://knowledgebase.cradlepoint.com/> for more help and answers to your other questions.

#### 3.3.1 Your USB or ExpressCard Modem Does Not Work With the Router

- If your USB data or ExpressCard is not working with the router, check the list of supported devices at <http://www.cradlepoint.com/modems> to ensure you are using a supported device and carrier. The device you are using must be supported on the carrier network providing your cellular service or it's considered an unsupported device, even if it is supported on another carrier's network.
- Sometimes a USB data modem needs to be updated or have other configurations set correctly in order to make a connection through the router. If your USB Modem has not been updated recently, it is recommended that you do so if it is having trouble connecting to the CBR400. Insert your USB data modem into your PC and access the Internet using the software provided by your cellular carrier. Follow the directions provided to complete the update. Once you have updated your USB data modem, reconnect the cellular device to your CradlePoint router and connect to the Internet.
- If you are using a 4G WiMAX modem you need to set the WiMAX Realm. This can be done on the administration pages. Log in using the hostname "[cp/](http://cp/)" or IP address "<http://192.168.0.1>" in your browser. On page 3 of the First Time Setup Wizard (go to **Getting Started** → **First Time Setup**), you can set the WiMAX Realm. Be sure to click **Apply** on page 4 to save the change.
- Some wireless carriers provide more than one Access Point Name (APN) that a modem can connect to. If you wish to specify the APN, this can be done on the administration pages. Log in using the hostname "[cp/](http://cp/)" or IP address "<http://192.168.0.1>" in your browser. Go to **Internet** → **Modem Settings**. In the **Modem Configuration** section, select your modem and click "Configure." There is an Access Point Name field: Enter the APN and click **Apply**. Some APN examples are **[isp.cingular](http://isp.cingular)**, **[ecp.tmobile.com](http://ecp.tmobile.com)**, and **[vpn.com](http://vpn.com)**. The modem must be removed and reinserted (or the router must be rebooted) for this change to take effect.

- If the above issues have been resolved and you can connect to the router but you cannot get Internet through it using your modem, you may need to upgrade the router firmware. Use your computer (you may need to plug your modem directly into your computer if you don't have another way to access the Internet) to download the latest firmware for the router (go to <http://www.cradlepoint.com/support/cbr400> and scroll over **firmware** at the bottom of the page). Then log in to the router administration pages and manually upload the firmware. Go to **System Settings** → **System Software** and click on “Manual Firmware Upload”.
- If you are still unable to access the Internet after following the above directions, contact CradlePoint Technical Support for further assistance.

### 3.3.2 You are Connected to the Router but Cannot Connect to the Internet

The status LEDs of your router will give you an indication whether or not a proper connection is being made. If the USB data modem LEDs are not illuminated, your modem is not connected and online. You may need to update firmware. Refer to the previous section, “[Your USB or ExpressCard Modem Does Not Work With The Router.](#)”

If you are still not online after updating, call CradlePoint Technical Support for further assistance.

## 4 WEB INTERFACE – ESSENTIALS

The CBR400 has a Web interface for configuration and administration of all features. The interface is organized with a button for toggling between **Basic Mode** and **Advanced Mode** and 5 tabs at the top of the screen:

- Getting Started
- Status
- Network Settings
- Internet
- System Settings

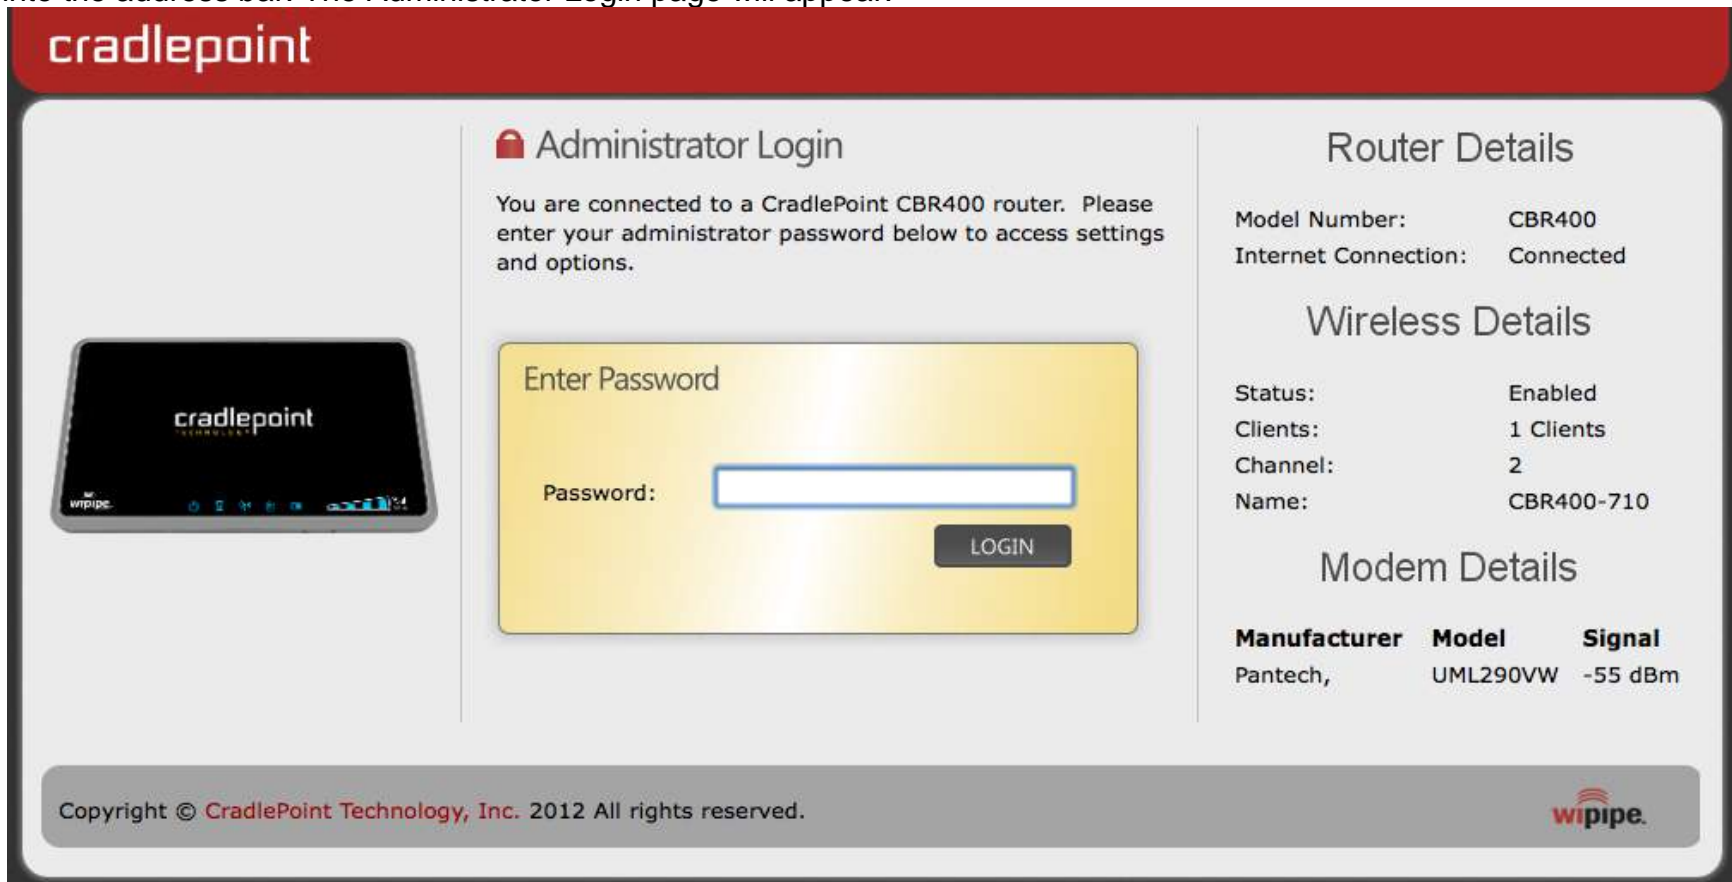

**Web Interface – Essentials** contains the following sections to help you more quickly and easy navigate these administration pages:

- 4.1 Administrator Login
- 4.2 Getting Started – First Time Setup
- 4.3 Quick Links
- 4.4 Configuration Pages
- 4.5 IP Passthrough Setup

### 4.1 Administrator Login

To access the administration pages, open a Web browser and type the hostname “[cp/](#)” or IP address “<http://192.168.0.1>” into the address bar. The Administrator Login page will appear.

Log in using your administrator password. Initially, this password can be found on the bottom of the CBR400 unit as the last eight digits of the unit’s MAC address.

You may have changed the administrator password during initial setup using the First Time Setup Wizard. Log in using your personalized administrator password.

If you have forgotten your personalized password, you can reset the CBR400 to factory defaults. When you reset the router, the administrator password will revert back to the **Default Password** (the last eight digits of the unit's MAC address). Press and hold the **reset button** on the router unit until the lights flash (10 seconds). You can then log in using the **Default Password**.

#### 4.1.1 Router Details

The Administrator Login page includes a quick-reference section that shows the following information:

##### **Router Details**

- **Model Number:** CBR400
- **Internet Connection:** Connected/Disconnected

##### **Wireless Details**

- **Status:** Enabled/Disabled
- **Clients:** The number of attached users.
- **Channel:** The channel number.
- **Name:** The name of the primary network. If you have more than one wireless network enabled, the additional network names will also be listed here.

##### **Modem Details**

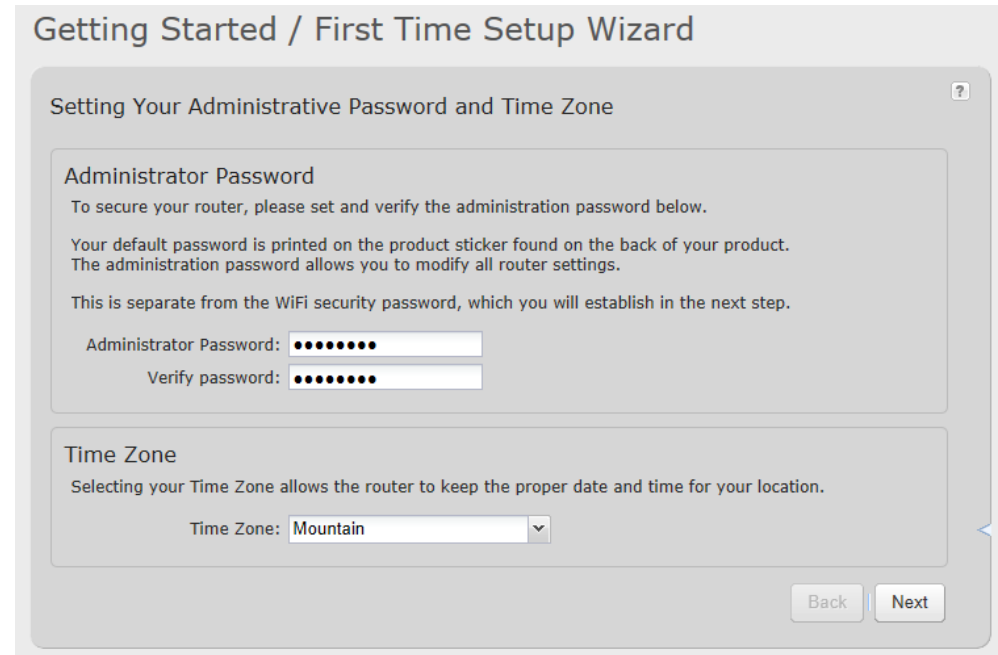

- **Manufacturer:** The name of the modem manufacturer (CradlePoint).
- **Model:** The name of the modem model (Internal LTE, for example).
- **Signal:** The strength of the signal (dBm).

## 4.2 Getting Started – First Time Setup

The **First Time Setup Wizard** will help you customize the name of your wireless network, change passwords to something you choose, and establish an optimal WiFi security mode. The CBR400 comes out of the box with a unique password at WPA1/WPA2 WiFi security level.

NOTE: Instructions for the **First Time Setup Wizard** are also located in the **Setup Guide** included with the CBR400.

- 1) Open a browser window and type “[cp/](#)” or “[192.168.0.1](#)” into the address bar. Press enter/return.
- 2) When prompted for your password, type the eight character **Default Password** found on the product label on the bottom of the CBR400 as the last 8 digits of the router’s MAC address.
- 3) When you log in for the first time, you will be automatically directed to the **FIRST TIME SETUP WIZARD**. (Otherwise, go to **Getting Started → First Time Setup**).
- 4) CradlePoint recommends that you change the router’s **ADMINISTRATOR PASSWORD**, which is used to log in to the administration pages. The administrator password is separate from the WiFi security password, although initially the **Default Password** is used for both.
- 5) You can select your **TIME ZONE** from a dropdown list. (This may be necessary to properly show time in your router log, but typically your router will automatically determine your time zone through your browser.) Click **NEXT**.

Getting Started / First Time Setup Wizard

Setting Your Administrative Password and Time Zone

**Administrator Password**  
To secure your router, please set and verify the administration password below.  
Your default password is printed on the product sticker found on the back of your product. The administration password allows you to modify all router settings.  
This is separate from the WiFi security password, which you will establish in the next step.

Administrator Password:

Verify password:

**Time Zone**  
Selecting your Time Zone allows the router to keep the proper date and time for your location.

Time Zone:

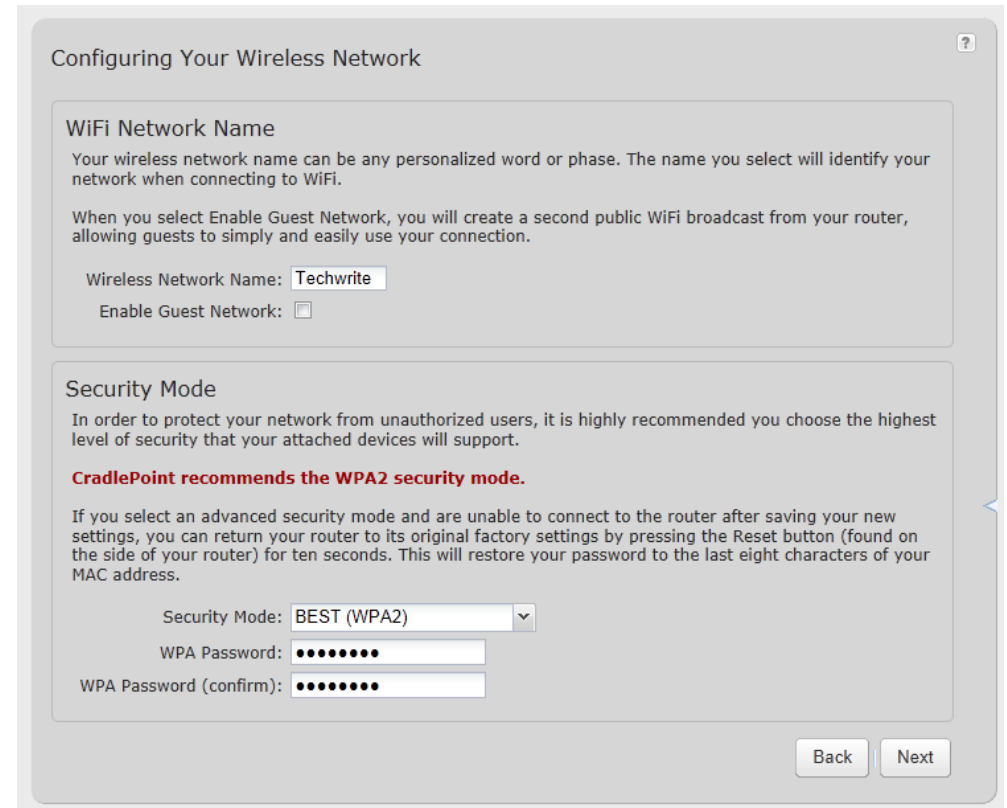

Back Next

- 6) CradlePoint recommends that you customize your WiFi Network Name. Type in your personalized Network name here. You can also enable the Guest Network feature (for more configuration options, see **Network Settings** → **WiFi / Local Networks** and the [Wireless \(WiFi\) Network Settings](#) section of this manual).

Choose the **WIFI SECURITY MODE** that best fits your needs:

- **BEST (WPA2):** Select this option if your wireless adapters support WPA2-only mode. This will connect to most new devices and is the most secure, but may not connect to older devices or some handheld devices such as a PSP.
- **GOOD (WPA1 & WPA2):** Select this option if your wireless adapters support WPA or WPA2. This is the most compatible with modern devices and PCs.
- **POOR (WEP):** Select this option if your wireless adapters only support WEP. This should only be used if a legacy device that only supports WEP will be connected to the router. WEP is insecure and obsolete and is only supported in the router for legacy reasons. The router cannot use 802.11n modes if WEP is enabled; WiFi performance and range will be limited.
- **NONE (OPEN):** Select this option if you do not want to activate any security features.

**CradlePoint recommends BEST (WPA2) WiFi security.** Try this option first and switch only if you have a device that is incompatible with WPA2.

Configuring Your Wireless Network

**WiFi Network Name**

Your wireless network name can be any personalized word or phase. The name you select will identify your network when connecting to WiFi.

When you select Enable Guest Network, you will create a second public WiFi broadcast from your router, allowing guests to simply and easily use your connection.

Wireless Network Name:

Enable Guest Network:

**Security Mode**

In order to protect your network from unauthorized users, it is highly recommended you choose the highest level of security that your attached devices will support.

**CradlePoint recommends the WPA2 security mode.**

If you select an advanced security mode and are unable to connect to the router after saving your new settings, you can return your router to its original factory settings by pressing the Reset button (found on the side of your router) for ten seconds. This will restore your password to the last eight characters of your MAC address.

Security Mode:

WPA Password:

WPA Password (confirm):

Choose a personalized **WPA PASSWORD** or **WEP KEY**. This password will be used to connect devices to the router's WiFi broadcast once the security settings have been saved.

- **WPA Password:** The WPA Password must be between 8 and 64 characters long. A combination of upper and lower case letters along with numbers and special characters is recommended to prevent hackers from gaining access to your network.
- **WEP Key:** A WEP Key must be either a hexadecimal value of 5 or 13 characters or a text value of 10 or 26 characters.

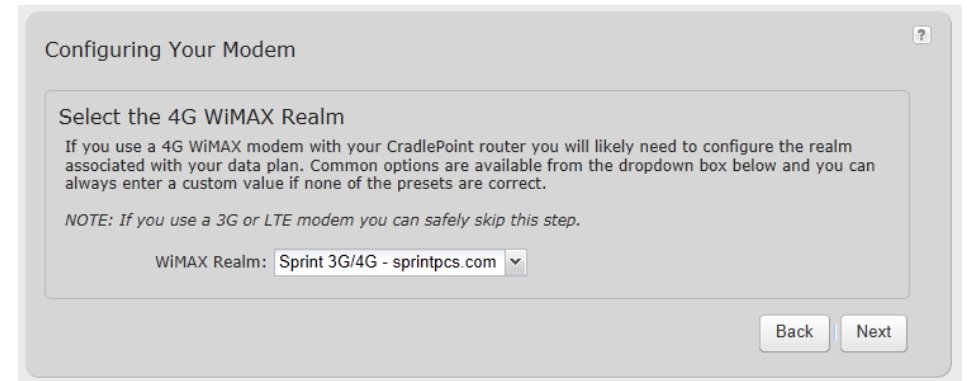

Click **NEXT**.

7) If you are using a 4G WiMAX modem, you will want to establish the Realm for your carrier. This setting ensures that the modem, when attached to the router, will properly connect to your carrier's wireless broadband service. The CBR400 will default to the Sprint Realm. Select your carrier from the dropdown menu (options shown below).

- Clear - clearwire-wmx.net
- Rover - rover-wmx.net
- Sprint 3G/4G - sprintpcs.com
- Xohm - xohm.com
- BridgeMAXX - bridgeMAXX.com
- Time Warner Cable - mobile.rr.com
- Comcast - mob.comcast.net

NOTE: If you use a 3G or LTE modem you can safely skip this step.

Click **NEXT**.

Configuring Your Modem

Select the 4G WiMAX Realm

If you use a 4G WiMAX modem with your CradlePoint router you will likely need to configure the realm associated with your data plan. Common options are available from the dropdown box below and you can always enter a custom value if none of the presets are correct.

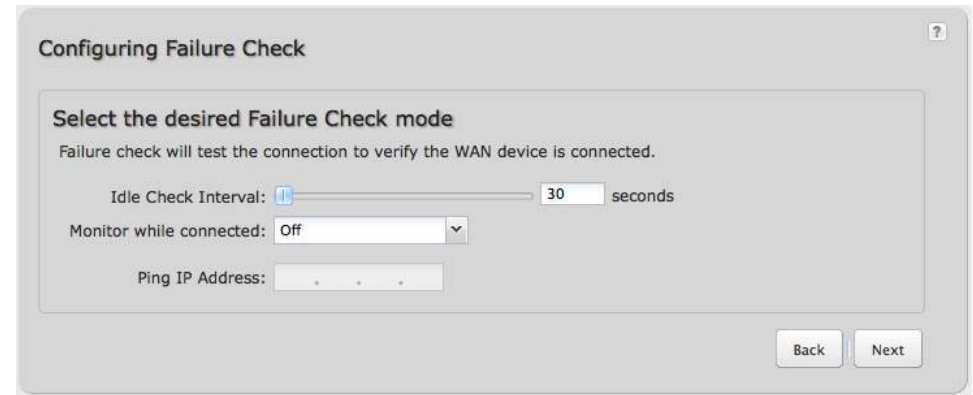

NOTE: If you use a 3G or LTE modem you can safely skip this step.

WiMAX Realm: Sprint 3G/4G - sprintpcs.com

Back Next

## 8) **Configuring Failure Check:**

It is possible for a WAN interface to go down without the router recognizing the failure. (For example: the carrier for a cellular modem goes dormant, or your Ethernet connection is properly attached to a modem but the modem becomes disconnected from its Internet source.) Enable Failure Check to ensure that you can get out to the Internet via your primary WAN connection. This option is disabled by default because it may use data unnecessarily. Use this in combination with failover, or for cellular modems, use this in combination with Aggressive Reset (**Internet** → **Connection Manager** under Modem Settings in the interface/rule editor).

**Idle Check Interval:** Set the number of seconds the router will wait between checks to see if the WAN is still available. (Default: 30 seconds. Range: 10-3600 seconds.)

**Monitor while connected:** Select from the dropdown menu. (Default: Off)

- **Active Ping:** A ping request will be sent to the Ping Target. If no data is received, the ping request will be retried 4 times at 5-second intervals. If still no data is received, the device will be disconnected and failover will occur. When “Active Ping” is selected, the next line gives an estimate of data usage in this form: “Active Ping could use as much as **9.3 MB** of data per month.” This amount depends on the Idle Check Interval.
- **Off:** Once the link is established the router takes no action to verify that it is still up.

**Ping IP Address:** If you selected “Active Ping”, you will need to input an IP address that will respond to a ping request. This IP address must be an address that can be reached through your WAN connection (modem/Ethernet). Some ISPs/Carriers block certain addresses, so choose an address that all of your WAN connections can use. For best results, select an established public IP address. *For example, you might ping Google Public DNS at 8.8.8.8 or Level 3 Communications at 4.2.2.2.*

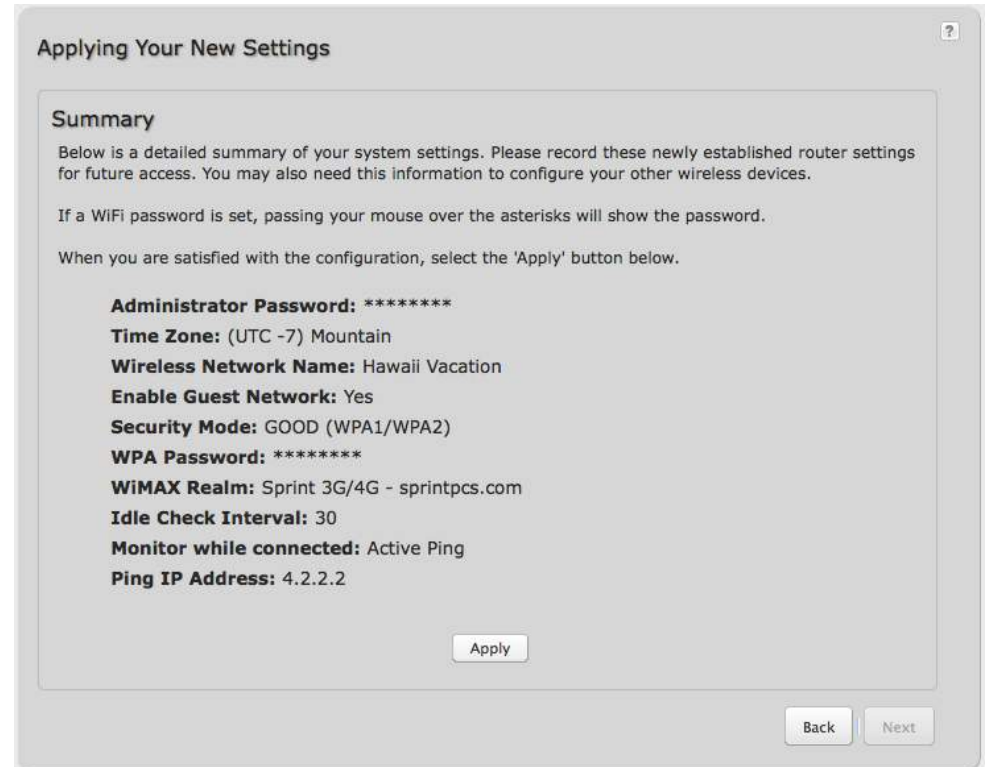

Click **NEXT**.

- 9) Review the details and record your wireless network name, administrative password, and WPA password (or WEP key). Move your mouse over the passwords to selectively reveal each password.

Please record these settings for future access. You may need this information to configure other wireless devices.

NOTE: If you are currently using this network, reconnect your devices to the network using the new wireless network name and security password.

Click **APPLY** to save the settings and update them to your router.

**Applying Your New Settings**

**Summary**

Below is a detailed summary of your system settings. Please record these newly established router settings for future access. You may also need this information to configure your other wireless devices.

If a WiFi password is set, passing your mouse over the asterisks will show the password.

When you are satisfied with the configuration, select the 'Apply' button below.

**Administrator Password:** \*\*\*\*\*

**Time Zone:** (UTC -7) Mountain

**Wireless Network Name:** Hawaii Vacation

**Enable Guest Network:** Yes

**Security Mode:** GOOD (WPA1/WPA2)

**WPA Password:** \*\*\*\*\*

**WiMAX Realm:** Sprint 3G/4G - sprintpcs.com

**Idle Check Interval:** 30

**Monitor while connected:** Active Ping

**Ping IP Address:** 4.2.2.2

Apply

Back Next

### 4.3 Quick Links

The CradlePoint logo in the upper left-hand corner of all the administration pages is a link to the Dashboard (**Status** → **Dashboard**), which displays fundamental information about the router.

The black bar across the top provides quick access to important information and controls.

**Internet Connection** This links to the Connection Manager (**Internet** → **Connection Manager**) where you can manage your Internet sources.

Click on the image of four signal bars to open a “Modem Connection Quality” popup window that shows the strength of your Internet signal.

**WiFi Clients** Click to view a signal strength indicator for your network, “WiFi Connection Strength”.

**Logout** Click to log out of the administration pages.

### 4.4 Configuration Pages

The following table shows the navigation layout of the administration pages. Click on the tabs along the top bar to reveal the following dropdown menus.

Getting Started	Status	Network Settings	Internet	System Settings
First Time Setup	Client List	Content Filtering	Connection Manager	Administration
IP Passthrough Setup	Dashboard	DHCP Server	Data Usage	Device Alerts
WiFi Protected Setup	GPS	DNS	GRE Tunnels	Hotspot Services
	GRE Tunnels	Firewall	VPN Tunnels	Managed Services
	Hotspot Clients	MAC Filter / Logging	WiFi as WAN / Bridge	Serial Redirector
	Internet Connections	Routing	WAN Affinity	System Control
	Statistics	WiFi / Local Networks		System Software
	System Logs	WiPipe QoS		
	VPN Tunnels			
	WiPipe QoS			

**Status** – Displays various types of information about your router such as a list of clients that are attached to your networks (**Client List**), the details of each Internet source your router is using (**Internet Connections**), and a map of your router’s location (**GPS**). Very few changes can be made from this tab because the primary purpose is to display information.

**Network Settings** – Provides configuration options for the networks, or LAN, created by your router. For example, you can enable a guest WiFi network (**WiFi / Local Networks**), set up rules to filter websites (**Content Filtering**), or create a traffic-shaping rule to set bandwidth priorities (**WiPipe QoS**).

**Internet** – Provides configuration options for the Internet sources, or WAN, used by the router. For example, you can set up a rule to track how much data you are using per month on a modem (**Data Usage**), set WiFi to be an Internet source (**WiFi as WAN / Bridge**), or set the fallback order for your Internet sources (**Connection Manager**).

**System Settings** – Provides broad administrative controls. For example, you can set up a Terms of Use page for your guest network (**Hotspot Services**), enable remote management of the router (**Administration**), or upgrade firmware (**System Software**).

#### 4.4.1 Network Settings vs. Internet

When using the Web interface, it will be important to pay attention to the difference between the **Internet source** for your CBR400 and the **network** created by the CBR400. The “**Internet**” tab broadly refers to the router’s source of Internet, while the “**Network Settings**” tab broadly refers to the network created by the router.

The following chart highlights this difference:

<p><b>Internet</b> tab</p> <p>Internet “input”</p> <p>Source for CBR400</p> <p>WAN (Wide Area Network)</p>	<p><b>Network Settings</b> tab</p> <p>Internet “output”</p> <p>Network created by CBR400</p> <p>LAN (Local Area Network)</p>
--	--

Examples:

- If you want to change the content filtering settings for the network created by the CBR400, go to the **Network Settings** tab.
- If you have multiple Internet sources (such a USB modem and an Ethernet connection) for which you would like to set priority levels, go to the **Internet** tab.

## 4.5 IP Passthrough Setup

You can quickly enable IP Passthrough with the IP Passthrough Setup Wizard available under **Getting Started** → **IP Passthrough Setup**. IP Passthrough takes a 3G/4G WAN data source (USB, ExpressCard) and passes the IP address through to Ethernet LAN.

Using this function requires many changes to your router configuration. The IP Passthrough Setup Wizard will automatically make these changes for you: simply read through the wizard and select **Enable IP Passthrough** on the second page. For further configuration options, see **Network Settings** → **WiFi / Local Networks**.

Review the list of changes to ensure they are compatible with your router needs:

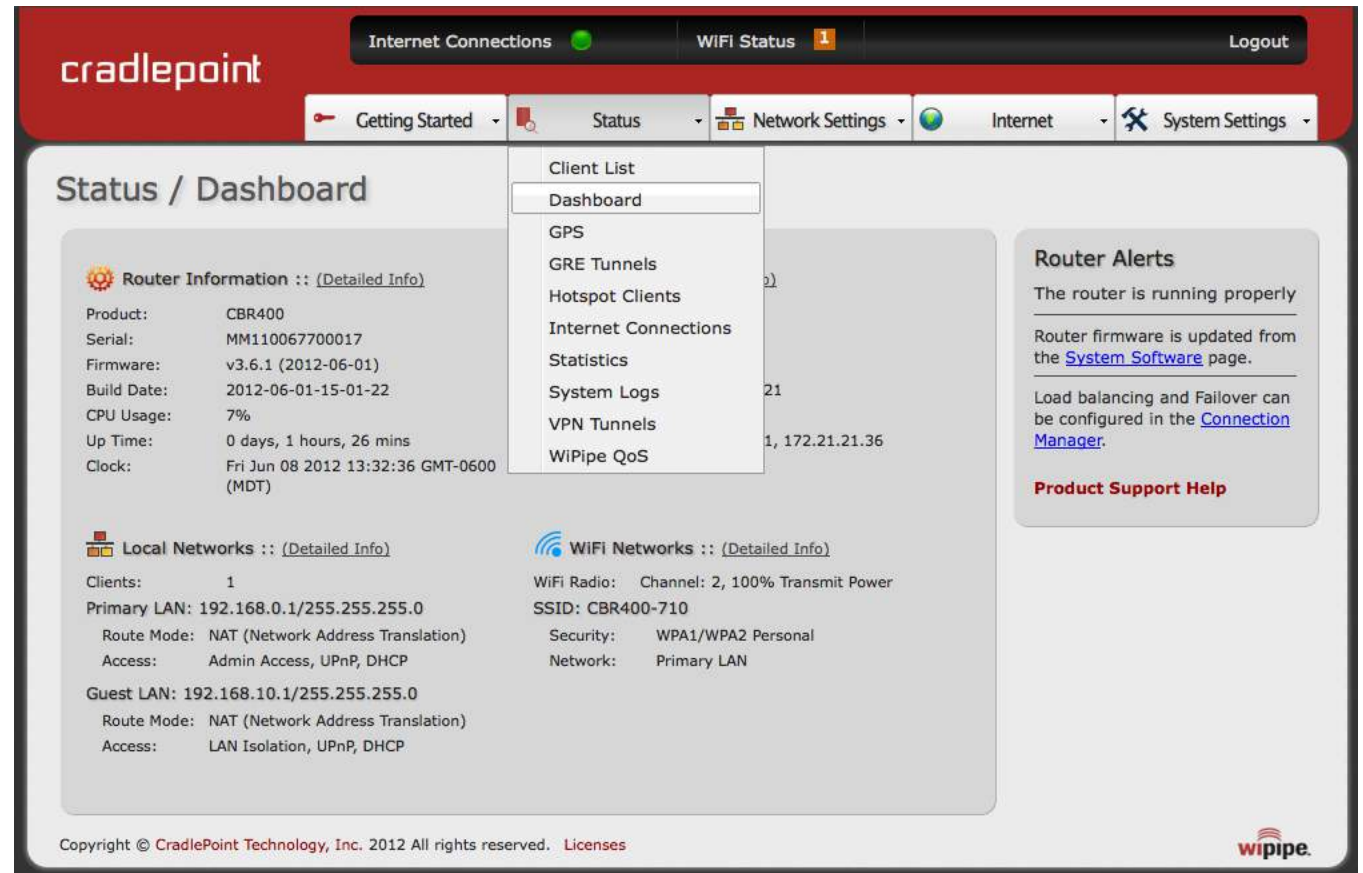

- All Ethernet ports will be set to LAN (i.e. you cannot use Ethernet as an Internet source for your router).
- All WAN devices will have Load Balance disabled and the highest priority device will be used.
- All network groups except the primary network group will be removed.
- All wireless interfaces will be removed from the primary network group. (It is possible to have a wireless interface associated with another network.)
- All router-based VPN and GRE services will be disabled.
- The Routing Mode will be set to IP Passthrough.
- The Subnet Selection Mode will be set to "Automatically Create Subnet"

## 5 STATUS

The Status tab displays information about many different aspects of the router. It provides access to 10 submenu options:

- Client List
- Dashboard
- GPS
- GRE Tunnels
- Hotspot Clients
- Internet Connections
- Statistics
- System Logs
- VPN Tunnels
- WiPipe QoS

**Router Information** :: ([Detailed Info](#))

Product: CBR400  
 Serial: MM110067700017  
 Firmware: v3.6.1 (2012-06-01)  
 Build Date: 2012-06-01-15-01-22  
 CPU Usage: 7%  
 Up Time: 0 days, 1 hours, 26 mins  
 Clock: Fri Jun 08 2012 13:32:36 GMT-0600 (MDT)

**Local Networks** :: ([Detailed Info](#))

Clients: 1  
 Primary LAN: 192.168.0.1/255.255.255.0  
 Route Mode: NAT (Network Address Translation)  
 Access: Admin Access, UPnP, DHCP  
 Guest LAN: 192.168.10.1/255.255.255.0  
 Route Mode: NAT (Network Address Translation)  
 Access: LAN Isolation, UPnP, DHCP

**WiFi Networks** :: ([Detailed Info](#))

WiFi Radio: Channel: 2, 100% Transmit Power  
 SSID: CBR400-710  
 Security: WPA1/WPA2 Personal  
 Network: Primary LAN

**Router Alerts**

The router is running properly

Router firmware is updated from the [System Software](#) page.

Load balancing and Failover can be configured in the [Connection Manager](#).

## 5.1 Client List

The Client List displays the specifications of each device connected to your router, including **Wireless** and **Wired** clients.

**Wireless Clients.** For each device using a wireless connection to your CBR400, the following information is displayed: **Hostname**, **IP**, **MAC**, **Connection**, and **Time Online**.

**Wired Clients.** For each device using a wired connection to your CBR400, the following information is displayed: **Hostname**, **IP**, and **MAC**.

The screenshot shows a web interface titled "Status / Client List". It contains two sections: "Wireless Clients" and "Wired Clients".

Wireless Clients				
Hostname	IP	MAC	Connection	Time Online
00-23-6c-7d-07-d!	192.168.0.164	00:23:6c:7d:07:d!	802.11n, 20 Mhz, 130 Mbps, -26 dBm	0:18:50

Wired Clients		
Hostname	IP	MAC
00-23-32-b4-b2-ca	192.168.0.103	00:23:32:b4:b2:ca

**Hostname:** The name by which each computer or device in a network is known.

**IP:** The "IP address," or "Internet Protocol address," specifies a location for each device.

**MAC:** This is the "MAC address", a factory-assigned identifier used to identify a specific attached computer or device.

**Connection:** Summary of the wireless connection. For example: **802.11n, 20 MHz, 130 Mbps, -26 dBm**

- **802.11n:** The transmission standard being used by the client. Possible values include 802.11a, 802.11b, 802.11g, and 802.11n. 802.11n is the newest and best standard, but some older devices may not support it.
- **20 MHz:** This is the channel width that defines the theoretical data rate (in megahertz) that the attached computer or device can send to or receive from the router. The channel width is set in **Network Settings** → **WiFi / Local Networks**. Typically this will be 20 MHz, but 40 MHz is possible if the router is set to use two adjacent 20 MHz channels. A wider channel can mean better performance, but not if there is too much interference. Even if 40 MHz is set in the WiFi Channel Width, the router may still fall back to 20 MHz if interference is found.
- **130 Mbps:** The transmit rate (in megabits per second) currently used to transmit packets from the router to the client. This rate changes automatically to match environmental conditions. Distance from the router, interference, etc can impact this value. Higher values indicate better performance. Devices can still function in the network with as little as 1 Mbps.

- **-26 dBm:** A relative measure of wireless signal quality (decibels relative to one milliwatt). This expresses theoretical best quality. The value is given as a negative exponent: -20 is a very good value while -80 is relatively poor. Signal quality can be reduced by distance, by interference from other radio-frequency sources (such as cordless telephones or neighboring wireless networks), and by obstacles between the router and the wireless device.

**Time Online:** Simply the amount of time the device has been connected to the router.

**Kick:** Click on this button to disconnect a client.

Wireless Clients					
Hostname	IP	MAC	Connection	Time Online	
00-23-6c-7d-07-	192.168.11.134	00:23:6c:7d:07:	802.11n, 20 MHz, 130 Mbps, -31 d	1:22:03	<input type="button" value="Kick"/>

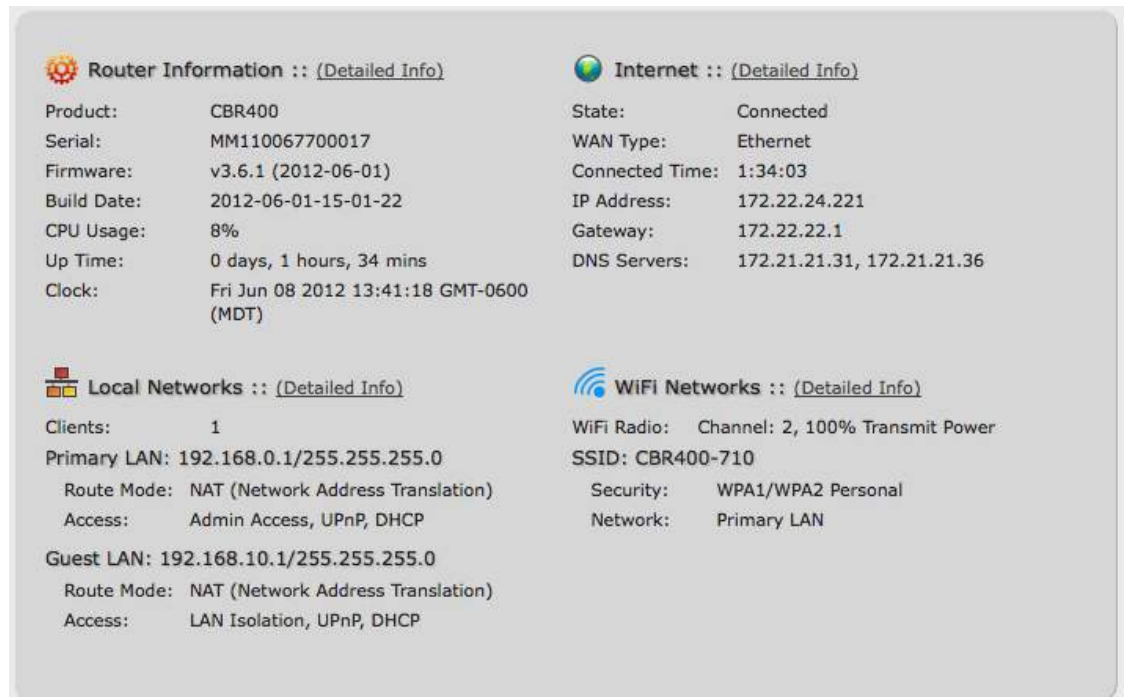

## 5.2 Dashboard

The **Dashboard** shows fundamental information about your router, divided into the following basic categories:

- **Router Information**
- **Internet**
- **Local Networks**
- **WiFi Networks**

For more in-depth information and/or configuration options, click on the [Detailed Info](#) link beside the category title. For each category, this links to:

- Router Information: [System Settings](#) → [Administration](#)
- Internet: [Internet](#) → [Connection Manager](#)
- Local Networks: [Network Settings](#) → [WiFi / Local Networks](#)
- WiFi Networks: [Network Settings](#) → [WiFi / Local Networks](#)

**Router Information :: (Detailed Info)**

Product:	CBR400
Serial:	MM110067700017
Firmware:	v3.6.1 (2012-06-01)
Build Date:	2012-06-01-15-01-22
CPU Usage:	8%
Up Time:	0 days, 1 hours, 34 mins
Clock:	Fri Jun 08 2012 13:41:18 GMT-0600 (MDT)

**Internet :: (Detailed Info)**

State:	Connected
WAN Type:	Ethernet
Connected Time:	1:34:03
IP Address:	172.22.24.221
Gateway:	172.22.22.1
DNS Servers:	172.21.21.31, 172.21.21.36

**Local Networks :: (Detailed Info)**

Clients:	1
Primary LAN:	192.168.0.1/255.255.255.0
Route Mode:	NAT (Network Address Translation)
Access:	Admin Access, UPnP, DHCP
Guest LAN:	192.168.10.1/255.255.255.0
Route Mode:	NAT (Network Address Translation)
Access:	LAN Isolation, UPnP, DHCP

**WiFi Networks :: (Detailed Info)**

WiFi Radio:	Channel: 2, 100% Transmit Power
SSID:	CBR400-710
Security:	WPA1/WPA2 Personal
Network:	Primary LAN

**Router Information:** “Detailed Info” links to **System Settings → Administration.**

- **Product:** CBR400
- **Serial:** The product serial number.
- **Firmware:** Gives the number of the current firmware version.
- **Build Date:** Year-month-day-hours-minutes-seconds for the most recent firmware upgrade.
- **CPU Usage:** Expressed as a percentage.
- **Up Time:** Total time for current session.
- **Clock:** Current local date and time.

To check for Firmware upgrades, see **System Settings → System Software.**

**Internet:** “Detailed Info” links to **Internet → Connection Manager.**

- **State:** Connected/Disconnected
- **Signal Strength:** Expressed as a percentage. (Signal Strength is not included if Ethernet is the WAN type.)
- **WAN Type:** Ethernet, Modem, or WiFi as WAN.
- **Connected Time:** The time the current Internet source (WAN) has been connected.
- **IP Address**
- **Gateway**
- **DNS Servers**

For general configuration options, see **Internet → Connection Manager.** For more in-depth Internet source configuration options see the appropriate settings page for your WAN type.

- **Internet → Ethernet Settings**
- **Internet → Modem Settings**
- **Internet → WiFi as WAN Settings**

The IP address and gateway describe your active WAN source.

For DNS server configuration options, see **Network Settings → DNS.**

**Local Networks:** “Detailed Info” links to **Network Settings → WiFi / Local Networks.**

- **Clients:** The number of current clients.

For each network, the following information is displayed:

- **Network Name: IP Address/Netmask**
  - **Route Mode:** NAT (Network Address Translation), Standard (NAT-less), Hotspot, or Disabled.
  - **Access:** Admin Access, LAN Isolation, UPnP (Universal Plug and Play), and/or DHCP.

To configure a network, see [Network Settings → WiFi / Local Networks](#).

**WiFi Networks:** “Detailed Info” links to [Network Settings → WiFi / Local Networks](#).

- **WiFi Radio: Channel:** 1-11. **Transmit Power** (Expressed as a percentage).

For each WiFi network, the following information is displayed:

- **SSID:** Service Set Identifier—an identifier or name for a wireless network.
  - **Security:** WPA2/WPA1/WEP Personal/Enterprise or Open; Isolated Clients
  - **Network:** The name of the local network.

To configure WiFi network settings see [Network Settings → WiFi / Local Networks](#).

### 5.2.1 Router Alerts

On the right side of the **Dashboard** page is a brief set of “**Router Alerts**” that state basic information such as whether the router is running properly. This will inform you about the availability of new firmware, for example.

**Router Alerts** includes links to the **System Software** page (for new firmware) and the **Connection Manager**.

#### Router Alerts

The router is running properly

Router firmware is updated from the [System Software](#) page.

Load balancing and Failover can be configured in the [Connection Manager](#).

**Product Support Help**

### 5.3 GPS

If GPS support is enabled and a modem capable of providing GPS coordinates is connected, this page will show a graphical view of your router's location. See the GPS section in **System Settings** → **Administration** to enable GPS support.

GPS information is only displayed if 1) the modem supports GPS, 2) your carrier allows the GPS functionality, and 3) the modem has sufficient GPS signal strength. If no information is displayed, check that both the modem and your carrier support GPS.<sup>1</sup> If GPS is supported make sure the modem is in an area where it can receive a signal from the GPS satellites.

#### Status / GPS Status

<sup>1</sup> By default, Sprint usually supports GPS on USB data modems and Verizon usually does not.

## 5.4 GRE Tunnels

View the status of configured GRE Tunnels. To set up or edit a GRE tunnel, go to **Internet** → **GRE Tunnels**.

Included information:

- Name
- Status
- Transmit (packets/bytes)
- Receive (packets/bytes)

The screenshot shows the Cradlepoint web interface. At the top, there is a navigation bar with the Cradlepoint logo on the left and several status indicators: "Internet Connections" with a green dot, "WIFI Status" with an orange square containing the number "1", and a "Logout" button. Below this is a secondary navigation bar with menu items: "Getting Started", "Status", "Network Settings", "Internet", and "System Settings". The main content area is titled "Status / GRE Tunnels". It features a table with the following columns: "Name", "Status", "Transmit (packets/bytes)", and "Receive (packets/bytes)". The table is currently empty. To the right of the table is a "Help Panel" with the text "View the status of the configured GRE tunnels." and a link for "Product Support Help". At the bottom of the page, there is a copyright notice: "Copyright © CradlePoint Technology, Inc. 2012 All rights reserved. Licenses" and the "wipipe." logo.

### 5.5 Hotspot Clients

View the status of the clients that have logged in through the Hotspot/Captive Portal. View:

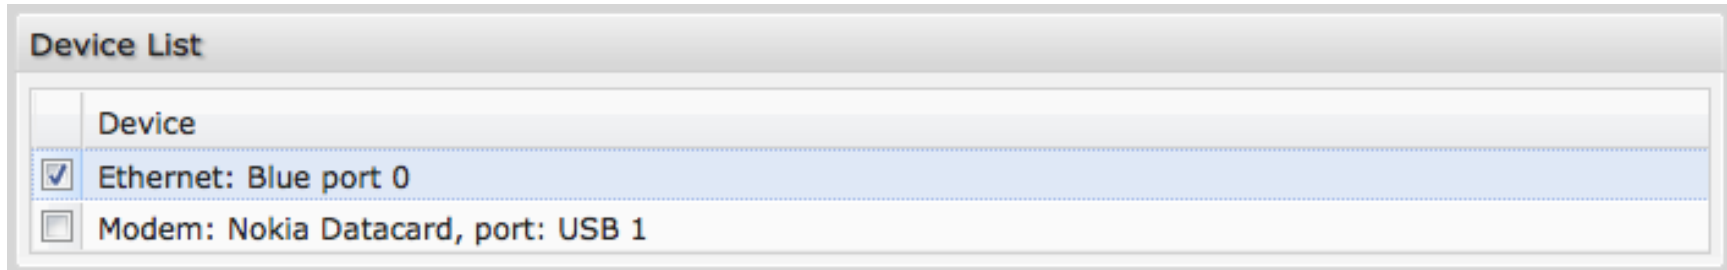

- Hostname
- IP address
- MAC address
- Data Usage (both IN and OUT)
- Time Online
- 

Authenticated Hotspot Clients					
Hostname	IP	MAC	Data Usage	Time Online	
00-23-6c-7d-07-d5	192.168.10.134	00-23-6c-7d-07-d5	2.7 MB IN 237.4 KB OUT	0:01:57	Revoke

You may revoke a client's access to the Internet by clicking the 'Revoke' button.

## 5.6 Internet Connections

The Internet Connections submenu option provides a list of attached WAN devices used as the Internet source for the CBR400. Select one of these devices to see detailed information about that particular device.

For each type of device, different information will be included in the **Device Information** section. Possible devices include:

- [Ethernet](#)
- [WiFi](#)
- [GSM Modem](#)
- [EVDO Modem](#)
- [WiMAX Modem](#)
- [LTE Modem](#)

Depending on the device, possible information will be in the following sections: Diagnostics, General Information, IP Information, and Statistics. For modems, the Diagnostics section provides specific information about how the modem is communicating with its carrier.

### 5.6.1 Ethernet

#### General Information

- **Unique Identifier** *wan*
- **Model**
- **Type** *ethernet*
- **Port**

#### IP Information

- **DNS Servers**
- **IP Address**
- **Gateway**

#### Statistics

- **Incoming Bytes**
- **Outgoing Bytes**
- **Connection Uptime (secs)**

Device Information: Gigabit Ethernet Switch	
Property	Value
<b>General Information</b>	
Unique Identifier	wan
Model	8316
Type	ethernet
Port	0
<b>IP Information</b>	
DNS Servers	172.22.22.23,172.21.21.31
IP Address	172.22.24.133
Gateway	172.22.22.1
<b>Statistics</b>	
Incoming Bytes	8627806
Outgoing Bytes	636892
Connection Uptime (secs)	906

## 5.6.2 WiFi as WAN

### Diagnostics

- **Connection State** (connected, idle, etc.)

### General Information

- **Product** *Wireless As WAN*
- **Unique Identifier**
- **Type** *wwan*

### IP Information

- **Netmask**
- **IP Address**

Outgoing Bits/Second	0
Incoming Bits/Second	0
Incoming Bytes	17089
Outgoing Bytes	7432

- **Outgoing Bytes**

## 5.6.5 WiMAX Modem (U300 – 4G)

### Diagnostics

For a WiMAX modem, the CINR and Signal Strength values are important as they show how strong the signal is and that has significant effects on how much data the router can download or send. You can place the router in different locations to see where you get better signal. You can also see a LED display of the current signal strength. Pressing the router's Signal Strength button will toggle the LED display on and off.

- **Base Station ID (BSID)**
- **Signal Strength(dBm)**
- **Center Frequency**
- **Calibration Status**—Don't worry if this says the modem is not calibrated.
- **Modem Firmware Version**
- **CINR**
- **Connection State** (connected, idle, etc.)

### General Information

- **Product** *U300 – 4G*
- **Protocol** *Ethernet Static*
- **Unique Identifier**
- **MAC**

Device Information: U300 - 4G	
Property	Value
⊟ Diagnostics	
Base Station ID (BSID)	
Signal Strength(dBm)	-128 dBm
Center Frequency	2498500 kHz
Calibration Status	Yes
Modem Firmware Version	5.2.2061053209
CINR	-32 dB
Transmit Power	0 dBm
Connection State	idle
⊟ General Information	
Product	U300 - 4G
Protocol	Ethernet Static

Statistics	
Outgoing Bits/Second	0
Incoming Bits/Second	0
Incoming Bytes	333454
Outgoing Bytes	89516

## 5.7 Statistics

The Statistics submenu option displays basic traffic statistics.

**Wireless Statistics:** View the signal strength and other wireless modem information. The wireless device's signal strength will only be displayed as long as it supports "Live Diagnostics." Sample rate and size can be adjusted from the dropdown boxes.

**Data Usage:** A measure of amount of information that is currently being sent or received through the network. Sample rate and size can be adjusted from the dropdown boxes.

**Failover/Failback/Load Balance:** An easy way to view current connective states of the devices plugged into the router as compared to the past. Sample rate and size can be adjusted from the dropdown boxes.

## 5.8 System Logs

The router automatically logs (records) events of possible interest in its internal memory. If there is not enough internal memory for all events, logs of older events are deleted, but logs of the latest events are retained. The log options allow you to filter the router logs so you can easily find relevant messages. This router also has external Syslog Server support so you can send the log files to a computer on your network that is running a Syslog utility.

**Auto Update:** The logs automatically refresh whenever the router creates a new message.

**Update:** Click to check for new router messages.

**Clear log:** Clear the log file.

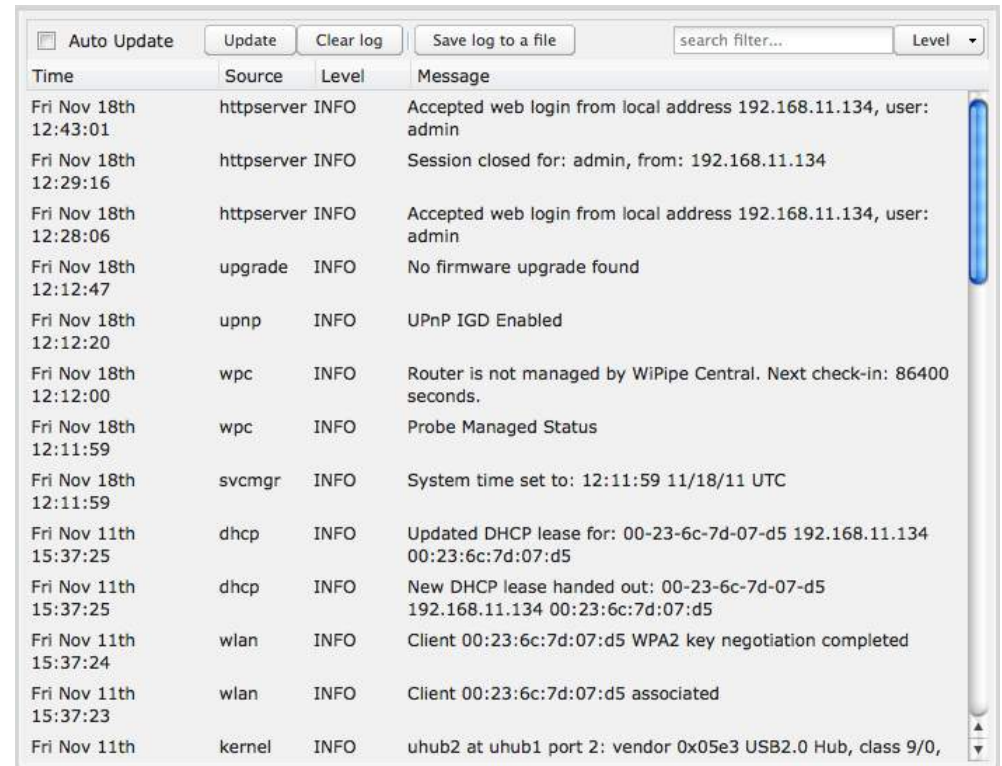

**Save log to a file:** This will open a dialog in your browser that will allow you to save the router's log to your computer.

**Search:** Enter keywords to find specific events.

**Level:** Select/Deselect from the following levels to filter messages by priority.

- Critical
- Error
- Warning
- Info

NOTE: The logs are erased whenever the router is rebooted or loses power..

Time	Source	Level	Message
Fri Nov 18th 12:43:01	httpserver	INFO	Accepted web login from local address 192.168.11.134, user: admin

## 5.10 WiPipe QoS

View the breakdown of packets and bytes sent and received associated with each WiPipe QoS rule.

WiPipe QoS is Enabled		
Queue	Transmit (packets/bytes)	Receive (packets/bytes)
Default	3197 / 319.23 KB	4893 / 5.62 MB
limit upload	0 / 0.00 bytes	0 / 0.00 bytes

## 6 NETWORK SETTINGS

The Network Settings tab provides access to 8 submenu options for administering the following functions/tasks. These functions are all related to controlling the LAN (Local Area Network), the network you set up with the CBR400.

- Content Filtering
- DHCP Server
- DNS
- Firewall
- MAC Filter / Logging
- Routing
- WiFi / Local Networks
- WiPipe QoS

The screenshot displays the Cradlepoint Network Settings interface. The top navigation bar includes 'Internet Connections', 'WiFi Status', and 'Logout'. The main menu shows 'Getting Started', 'Status', 'Network Settings', 'Internet', and 'System Settings'. The 'Network Settings' dropdown menu is open, listing options: Content Filtering, DHCP Server, DNS, Firewall, MAC Filter / Logging, Routing, WiFi / Local Networks (highlighted), and WiPipe QoS.

The main content area is titled 'Network Settings / WiFi / Local Networks' and shows 'Local IP Networks' with 'Add', 'Edit', and 'Remove' buttons. Two network configurations are listed:

- Primary LAN: 192.168.0.1 / 255.255.255.0**
  - DHCP Server: Enabled
  - Schedule: Disabled
  - Routing Mode: NAT (Network Address Translation)
  - Access Control: Admin Access, UPnP Gateway
  - Attached Interfaces:
    - Ethernet Group: undefined
    - WiFi Access Point: SSID: CBR400-710
- Guest LAN: 192.168.10.1 / 255.255.255.0**
  - DHCP Server: Enabled
  - Schedule: Disabled
  - Routing Mode: NAT (Network Address Translation)
  - Access Control: LAN Isolation, UPnP Gateway
  - Attached Interfaces:
    - WiFi Access Point: SSID: Public-710

A 'Help Panel' on the right side contains the text: 'This section is used to configure the network settings for your router.' and a link for 'Product Support Help'.

## 6.1 Content Filtering

You have two main options for filtering content in a network created through your CBR400.

- 1) **Domain / URL Filter Rules:**  
Create a list of websites that will be either disallowed (facebook.com, for example) or allowed exclusively (your company's website, for example).
- 2) **OpenDNS Content Filtering:**  
Allows several options for filtering rules.

**Domain / URL Filter Rules**

Domain / URL Name	Enabled
<input type="checkbox"/> Domain / URL Name	Enabled

**Filter Rules Settings**

Enable Whitelist.:

Filter by IP Addresses:

Apply Undo

To create **Domain / URL Filter Rules**, simply input one or more website domain names or URLs. By default, these websites will be disallowed as part of a Blacklist. You can change this to a Whitelist to exclusively allow these sites.

**Enable Whitelist:** By default, Domain / URL filters allow you to **block** access from your network to any external domain or website. Enabling this as a Whitelist instead will allow access to only those sites in the list, blocking all other websites. Some sites use multiple domains, so each of them would need to be added to the list to get full site functionality. The default behavior enables the Whitelist for URLs only. Select Filter by IP Addresses to use IP addresses with the Whitelist.

**Filter by IP Addresses:** Enabling this will cause the router to block/allow URLs by the IP addresses they point to. This option will also force all DNS traffic through the router to ensure the correct IP address is returned during a DNS lookup.

**Using IP address filtering with URLs is not recommended.** Some URLs do not return all valid IP addresses with DNS, so these may be missed. Another possible problem is that example.com and www.example.com refer to the same website but may return different IP addresses.

### 6.1.1 OpenDNS

OpenDNS is a service that protects you online by filtering websites. OpenDNS protects you from phishing websites and URL typos once you select a filtering level.

- **None:** Disables Web filtering that uses OpenDNS,
- **Minimal:** Filters phishing and URL typos.
- **Good:** Filters any Web site containing pornography and enables typo and phishing redirection.
- **Better:** Filters more nudity, sexuality, and tasteless content.
- **Best:** Filters more nudity, sexuality, and tasteless content. Selecting “Best” will filter all content that is deemed adult content by OpenDNS.
- **Custom:** Custom OpenDNS settings. See below for more information.

In addition to the standard filtering levels, you have the following options for filter control:

**Custom OpenDNS:** To use the Custom OpenDNS setting you need to first create an OpenDNS account. You can create an account at [OpenDNS](#) and click on the “Create Account” link. Follow the onscreen instructions to create an account.

Once you have an OpenDNS account, enter your account information in order to use your Custom OpenDNS settings. Custom OpenDNS settings use the [DNS-O-MATIC](#) (an OpenDNS Service) API to update the IP address of your

**OpenDNS Content Filtering**

**None:**  No filtering.

**Minimal:**  Filters phishing and URL typos.

**Good:**  Additionally filters pornography websites.

**Better:**  Additionally filters nudity, sexuality, and tasteless websites.

**Best:**  Filters all content which is deemed adult content by OpenDNS.

**Custom:**  Custom OpenDNS settings. Enter OpenDNS account information below.

Enable OpenDNS ISP Filter Bypass

Algorithm:

Apply Undo

**Custom:**  Custom OpenDNS settings. Enter OpenDNS account information below.

**OpenDNS Account Information**

Network Name:

Username:

Password:

Verify Password:

OpenDNS network. In order for Custom settings to work you need to login to [DNS-O-MATIC](#) using your OpenDNS credentials and "Add A Service" for the network specified above.

**Enable OpenDNS ISP Filter Bypass Algorithm:** It is possible that your Internet Service Provider (ISP) uses the port that OpenDNS is configured to access, port 53, which will prevent OpenDNS filtering. If OpenDNS does not appear to be working correctly, enabling this will attempt to bypass those ports when using an OpenDNS content filtering level.

## 6.2 DHCP Server

DHCP stands for Dynamic Host Configuration Protocol. The built-in DHCP server automatically assigns IP addresses to the computers and other devices on each local area network (LAN). In this section you can view a list of assigned IP addresses and reserve IP addresses for particular devices.

**Active Leases:** A list of devices that have been provided DHCP leases. The DHCP server automatically assigns these leases. This list will not include any devices that have static IP addresses on the network.

**Reservations:** This option lets you reserve IP addresses; you can assign the same IP address to the network device with the specified MAC address any time it requests an IP address. This is almost the same as

when a device has a static IP address except that the device must still request an IP address from the router. The router will provide the device the same IP address every time. DHCP Reservations are helpful for server computers on the local network that are hosting applications such as Web and FTP. Servers on your network should either use a static IP address or a reservation.

While you have the option to manually input the information to reserve an IP address (Hostname, Hardware Addr, IP Addr), it is much simpler to select a device under the **Active Leases** section and click “**Reserve**.” The selected device’s information will automatically be added under **Reservations**.

Active Leases					
<input type="button" value="Reserve"/>					
	Hostname	IP Addr	Hardware Addr	Client ID	Expiration
<input type="checkbox"/>	00-23-6c-7d-07-d5	192.168.2.134	00:23:6c:7d:07:d5	01:00:23:6c:7d:07:c	9 hours, 20 mins

Reservations				
<input type="button" value="Add"/> <input type="button" value="Edit"/> <input type="button" value="Remove"/>				
	Hostname	Hardware Addr	IP Addr	Enabled
<input type="checkbox"/>				

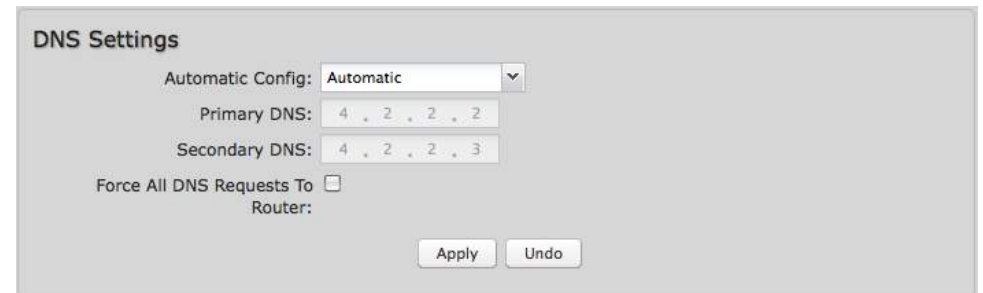

## 6.3 DNS

DNS, or Domain Name System, is a naming system that translates between domain names (www.cradlepoint.com, for example) and Internet IP addresses (206.207.82.197). A DNS server acts as an Internet phone book, translating between names that make sense to people and the more complex numerical identifiers. The DNS page for the CBR400 has these distinct functions:

- **DNS Settings:** By default your router is set to automatically acquire DNS servers through your Internet provider (Automatic). **DNS Settings** allows you to specify DNS servers of your choosing instead (Static).
- **Dynamic DNS Configuration:** Allows you to host a server (Web, FTP, etc.) using a domain name that you have purchased (www.yourname.com) with your dynamically assigned IP address.
- **Known Hosts Configuration:** Allows you to map a name (printer, scanner, laptop, etc.) to an IP address of a device on the network.

### 6.3.1 DNS Settings

You have the option to choose specific DNS servers for your network instead of using the DNS servers assigned by your Internet provider. The default DNS servers are usually adequate. You may want to assign DNS servers if the default DNS servers are performing poorly, if you want WiFi clients to access DNS servers that you use for customized addressing, or if you have a local DNS server on your network.

**Automatic Config:** Automatic or Static (default: Automatic). Switching to “Static” enables you to set specific DNS servers in the **Primary DNS** and **Secondary DNS** fields.

**Primary DNS** and **Secondary DNS:** If you choose to specify your DNS servers, then enter the IP addresses of the servers you want as your primary and secondary DNS servers in these fields. For example, Google Public DNS servers have the IP addresses 8.8.8.8 and 8.8.4.4 while 4.2.2.2 and 4.2.2.3 are servers from Level 3 Communications.

**Force All DNS Requests To Router:** Enabling this will redirect all DNS requests from LAN clients to the router's DNS server. This will allow the router even more control over IP addresses even when clients have their own DNS servers statically set.

### 6.3.2 Dynamic DNS Configuration

The Dynamic DNS feature allows you to host a server (Web, FTP, etc.) using a domain name that you have purchased (www.yourname.com) with your dynamically assigned IP address. Most broadband Internet Service Providers assign dynamic (changing) IP addresses. When you use a Dynamic DNS service provider, you can enter your host name to connect to your server, no matter what your IP address is.

**Enable Dynamic DNS:** Enable this option only if you have purchased your own domain name and registered with a Dynamic DNS service provider.

**Server Type.** Select a Dynamic DNS service provider from the pull-down list:

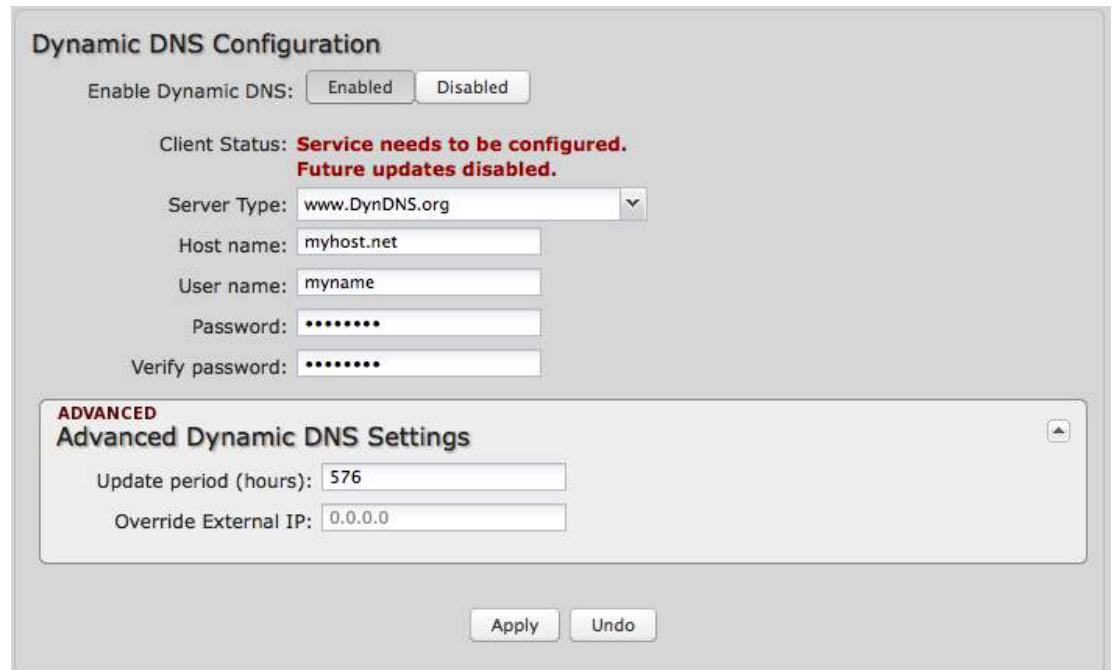

- www.DynDNS.org
- www.DNSomatic.com
- www.ChangeIP.com
- www.NO-IP.com
- Custom Server (DynDNS clone)

**Custom Server Address.** Only available if you select Custom Server from the Server Address dropdown list. Enter your custom dynamic DNS server address here. The server must support the Dynamic DNS protocol. See [www.dyndns.org](http://www.dyndns.org) for details. Example: **myserver.mydomain.net**.

**Host name:** Enter your host name, fully qualified. For example: **myhost.mydomain.net**.

**User name:** Enter the user name or key provided by the Dynamic DNS service provider. If the Dynamic DNS provider supplies only a key, enter that key for both the **User name** and **Password** fields.

**Password:** Enter the password or key provided by the Dynamic DNS service provider.

The screenshot shows the 'Dynamic DNS Configuration' web interface. At the top, there is a title 'Dynamic DNS Configuration'. Below it, there are two radio buttons for 'Enable Dynamic DNS': 'Enabled' (selected) and 'Disabled'. A message below reads 'Client Status: Service needs to be configured. Future updates disabled.' The 'Server Type' is set to 'www.DynDNS.org' in a dropdown menu. The 'Host name' field contains 'myhost.net', 'User name' contains 'myname', 'Password' and 'Verify password' fields are masked with dots. Below these fields is an 'ADVANCED' section titled 'Advanced Dynamic DNS Settings' with a collapse icon. It contains two input fields: 'Update period (hours):' with the value '576' and 'Override External IP:' with the value '0.0.0.0'. At the bottom right, there are 'Apply' and 'Undo' buttons.

### 6.3.3 Advanced Dynamic DNS Settings

**Update period (hours).** (Default: 576) The time between periodic updates to the Dynamic DNS, if your dynamic IP address has not changed. The timeout period is entered in hours so valid values are from 1 to 8760.

**Override External IP.** The external IP is usually configured automatically during connection. However, in situations where the unit is within a private network behind a firewall or router, the network's external IP address will have to be manually configured in this field.

You may find out what your external IP address is by going to <http://myip.dnsomatic.com/> in a web browser.

### 6.3.4 Known Hosts Configuration

The Known Hosts Configuration feature allows you to map a name (printer, scanner, laptop, etc.) to an IP address of a device on the network. This assigns a new hostname that can be used to conveniently identify a device within the network, such as an office printer.

Click **Add** to name a device in your network.

Fill in the following fields:

- **Hostname:** Choose a name that is meaningful to you. No spaces are allowed in this field.
- **IP address:** The address of the device within your network.

EXAMPLE: a personal laptop with IP address 192.168.0.164 could be assigned the name "MyLaptop".

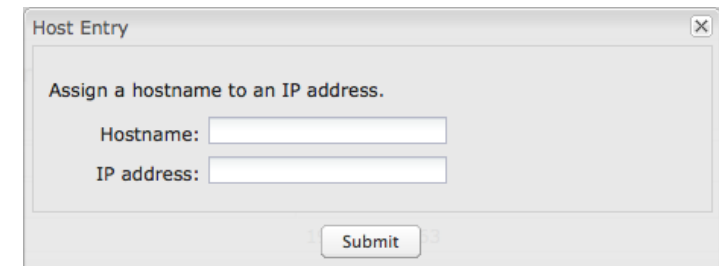

Since the assigned name is mapped to an IP address, the device's IP address should not change. To ensure that the device keeps the same IP address, go to the "Reservations" section under **Network Settings → DHCP Server** and reserve the IP address for the device.

Known Hosts Configuration

Add Edit Remove

Hostname	IP address
MyLaptop	192.168.0.164

Host Entry

Assign a hostname to an IP address.

Hostname:

IP address:

Submit

## 6.4 Firewall

The router automatically provides a firewall. Unless you configure the router to the contrary, the router does not respond to unsolicited incoming requests on any port, thereby making your LAN invisible to cyber attackers.

However, some network applications cannot run with a tight firewall. Those applications need to selectively open ports in the firewall to function correctly. The options on this page control ways of opening the firewall to address the needs of specific types of applications.

### 6.4.1 Port Forwarding Rules

A port forwarding rule allows traffic from the Internet to reach a computer on the inside of your network. For example, a port forwarding rule might be used to run a Web server.

**Exercise caution when adding new rules as they impact the security of your network.**

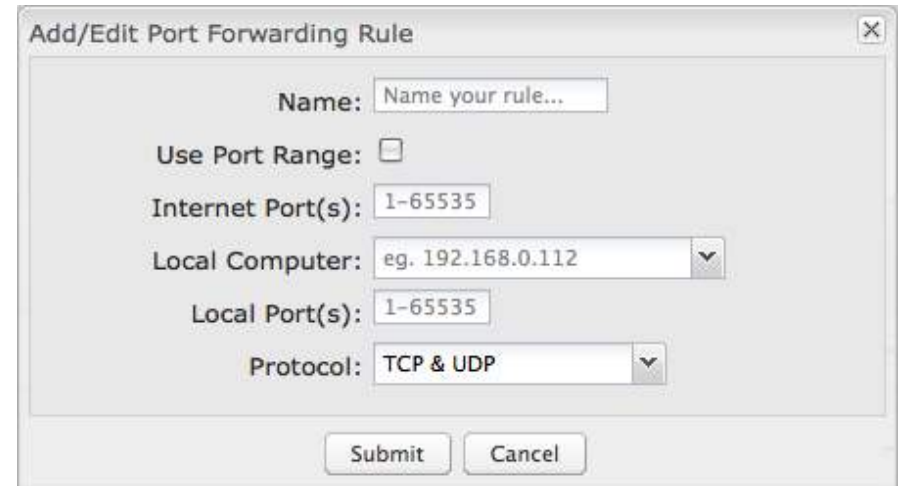

Click **Add** to create a new port forwarding rule, or select an existing rule and click **Edit**.

#### Add/Edit Port Forwarding Rule

- **Name:** Name your rule.
- **Use Port Range:** Changes the selection options to allow you to input a range of ports (if desired).
- **Internet Port(s):** The port number(s) as you want it defined on the Internet. Typically these will be the same as the local port numbers, but they do not have to be. These numbers will be mapped to the local port numbers.
- **Local Computer:** Select the IP address of an attached device from the dropdown menu, or manually input the IP address of a device.

<input type="checkbox"/>	Name	Internet Port(s)	Forwarding to	Protocol

**Add/Edit Port Forwarding Rule**

Name:

Use Port Range:

Internet Port(s):

Local Computer:

Local Port(s):

Protocol:

- **Local Port(s):** The port number(s) that corresponds to the service (Web server, FTP, etc) on a local computer or device. For example, you might input “80” in the **Local Port(s)** field to open a port for a Web server on a computer within your network. The **Internet Port(s)** field could then also be 80, or you could choose another port number that will be used across the Internet to access your Web server. If you choose a number other than 80 for the Internet Port, connections to that number will be mapped to 80—and therefore the Web server—within your network.
- **Protocol:** Select from the following options in the dropdown menu:
  - TCP
  - UDP
  - TCP & UDP
- Click **Submit** to save your completed port forwarding rule.

<input type="checkbox"/>	Name	Direction	Action	IP Source	IP Destination	Enabled
--------------------------	------	-----------	--------	-----------	----------------	---------

## 6.4.2 IP Filter Rules (Advanced)

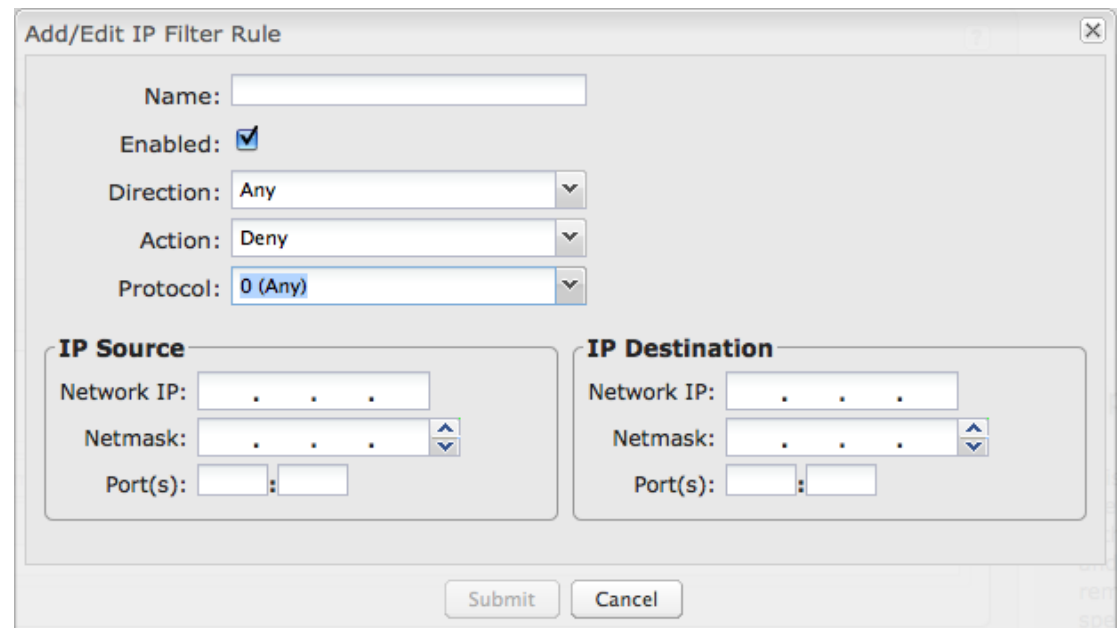

An "Incoming" IP filter rule restricts remote access to computers on your local network. "Outgoing" filter rules prevent computers on your local network from initiating communication to the address range specified in the rule.

This feature is especially useful when combined with port forwarding and/or DMZ to restrict remote access to a specified host or network range. For example, in order to host a server you might have opened ports with a port forwarding rule that could expose your LAN to cyber attacks. With an incoming IP filter rule, you can restrict the access to your LAN to only known devices.

- **Name:** Name your rule.
- **Enabled:** Selected by default.
- **Direction:** "Any," "Incoming," or "Outgoing"
- **Action:** "Allow" or "Deny"
- **Protocol:** Any, ICMP, TCP, UDP, GRE, ESP, or SCTP.

### IP Source / IP Destination

- **Network IP:** Optional field to specify a matching network IP address for this rule to match against.
- **Netmask:** Use this to define a subnet size this rule will match against.
- **Port(s):** Use for a single port or a range of ports. Fill in the left side for a single port.

Use **Network IP**, **Netmask**, and **Port(s)** to specify the ports and addresses for which the rule applies. You can specify a range of ports or a single port. Similarly, the netmask can be used to define either a range of addresses (i.e. 255.255.255.0) or a single address (255.255.255.255).

If you leave these values blank, then all IP addresses and ports will be included. **IP Source** and **IP Destination** options can be used to differentiate between the directions that packets go. You could permit packets to come from particular IP addresses but then not allow packets to return to those addresses.

**Example of an IP Filter Rule:** Suppose you have opened a port in your firewall in order to run a server. Someone, Johnny, is abusing that opening, so you would like to restrict his access. Create a rule that will deny Johnny's IP address.

#### **Add IP Filter Rule**

- **Name:** No more Johnny
- **Enabled:** Selected
- **Direction:** Incoming
- **Action:** Deny
- **Protocol:** Any

#### **IP Source**

- **Network IP:** 172.22.24.160 (Johnny's IP address)
- **Netmask:** 255.255.255.255 (This netmask restricts the rule to one single address).
- **Port(s):** 80

### 6.4.3 DMZ: DeMilitarized Zone (Advanced)

A DMZ host is effectively not firewalled in the sense that any computer on the Internet may attempt to remotely access network services at the DMZ IP address. Typical uses involve running a public Web server or sharing files.

Input the **IP Address** of a single device in your network to create a DeMilitarized Zone for that device. To ensure that the IP address of the selected device remains consistent, go to the “Reservations” section under **Network Settings** → **DHCP Server** and reserve the IP address for the device.

**As with port forwarding, use caution when enabling the DMZ feature as it can threaten the security of your network. Only use DMZ as a last resort.**

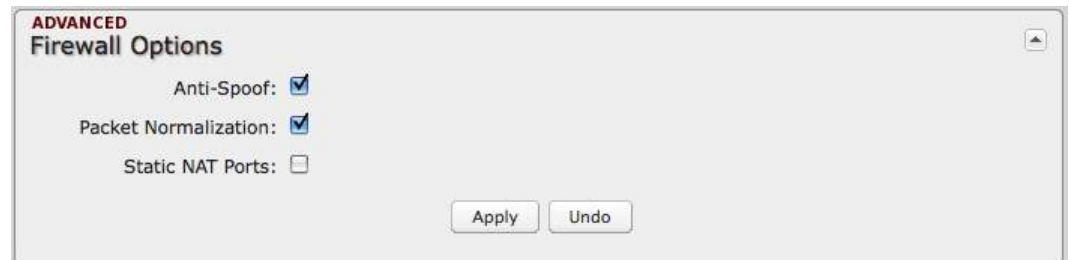

### 6.4.4 Firewall Options (Advanced)

**Anti-Spoof:** Anti-Spoof checks help protect against malicious users faking the source address in packets they transmit in order to either hide themselves or to impersonate someone else. Once the user has spoofed their address they can launch a network attack without revealing the true source of the attack or attempt to gain access to network services that are restricted to certain addresses.

**Packet Normalization:** Normalizing packets helps secure the router in untrusted environments. It does so by "scrubbing" packets that are ambiguous or might represent a break-in attempt. Packet Normalization also helps insure reliable connectivity for some WAN devices such as WiMAX modems. Only disable this option if you are sure you do not need it.

**Static NAT Ports:** If enabled the source port does not translate in TCP and UDP packets during NAT. Some NAT traversal protocols such as STUN(T) require that the source port stay the same when traversing the firewall.

### 6.4.5 Remote Administration Access Control (Advanced)

#### Enable Remote Administration Access Control:

Selecting this option allows you to make remote administration tools available to only the specified IP addresses. Access from all other IP addresses will be blocked. This option only filters IP addresses: you must enable Remote Management separately ([System Settings](#) → [Administration](#)).

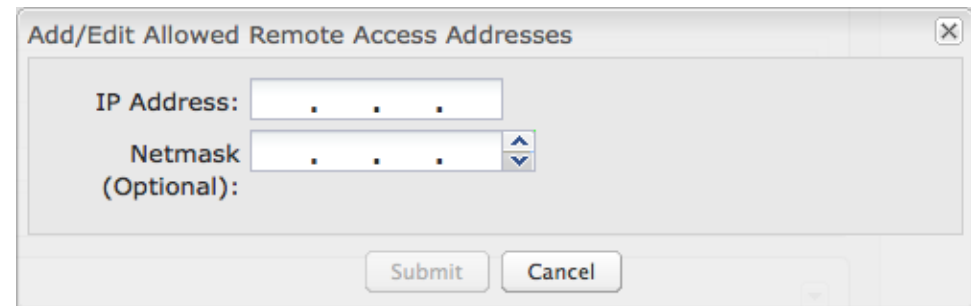

The services affected by this include remote HTTP, HTTPS, SNMP, and SSH configuration tools. This does not restrict access to LAN-based administration, i.e. devices within your network still have administration access. The individual remote administration services can be enabled under [System Settings](#) → [Administration](#) --> Remote Management.

#### Remote Administration Access Control Editor

**IP Address:** The IP address that will be allowed to access administrative services through the WAN.

**Netmask (Optional):** The netmask allows you to specify what IP address sets will be allowed access. If this field is left empty a netmask of 255.255.255.255 will be used, which means that only the single specified IP address would have remote administration access.

## 6.5 MAC Filter / Logging

A MAC (Media Access Control) address is a unique identifier for a computer or other device. This page allows you to manage clients by MAC address. You can filter clients by MAC addresses and/or keep a log of devices connected to your router.

### 6.5.1 Filter Configuration

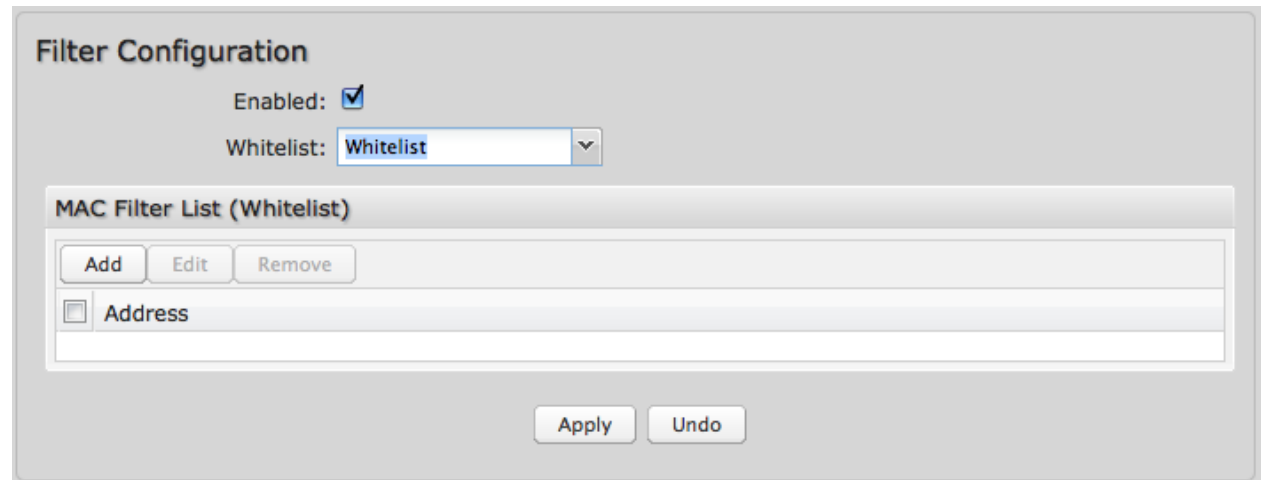

The MAC Filter allows you to create a list of devices that have either exclusive access (whitelist) or no access (blacklist) to your wireless LAN.

**Enabled:** Click to allow MAC Filter options.

**Whitelist:** Select either “Whitelist” or “Blacklist” from a dropdown menu. In “Whitelist” mode, the router will restrict WiFi access to all computers except those contained in the “MAC Filter List” panel. In “Blacklist” mode, listed devices are completely blocked from WiFi access.

**MAC Filter List (Whitelist or Blacklist):** Add devices to either your whitelist or blacklist simply by inputting each device’s MAC address.

NOTE: Use caution when using the MAC Filter to avoid accidentally blocking yourself from accessing the router.

**Filter Configuration**

Enabled:

Whitelist: Whitelist ▼

**MAC Filter List (Whitelist)**

<input type="button" value="Add"/> <input type="button" value="Edit"/> <input type="button" value="Remove"/>	
<input type="checkbox"/>	Address
<input type="checkbox"/>	

## 6.5.2 MAC Logging Configuration

**Enable MAC Logging:** Enabling MAC Logging will cause the router to log MAC addresses that are connected to the router. MAC addresses that you do not want to have logged (addresses that you expect to be connected) should be added to the “Ignored MAC Addresses” list.

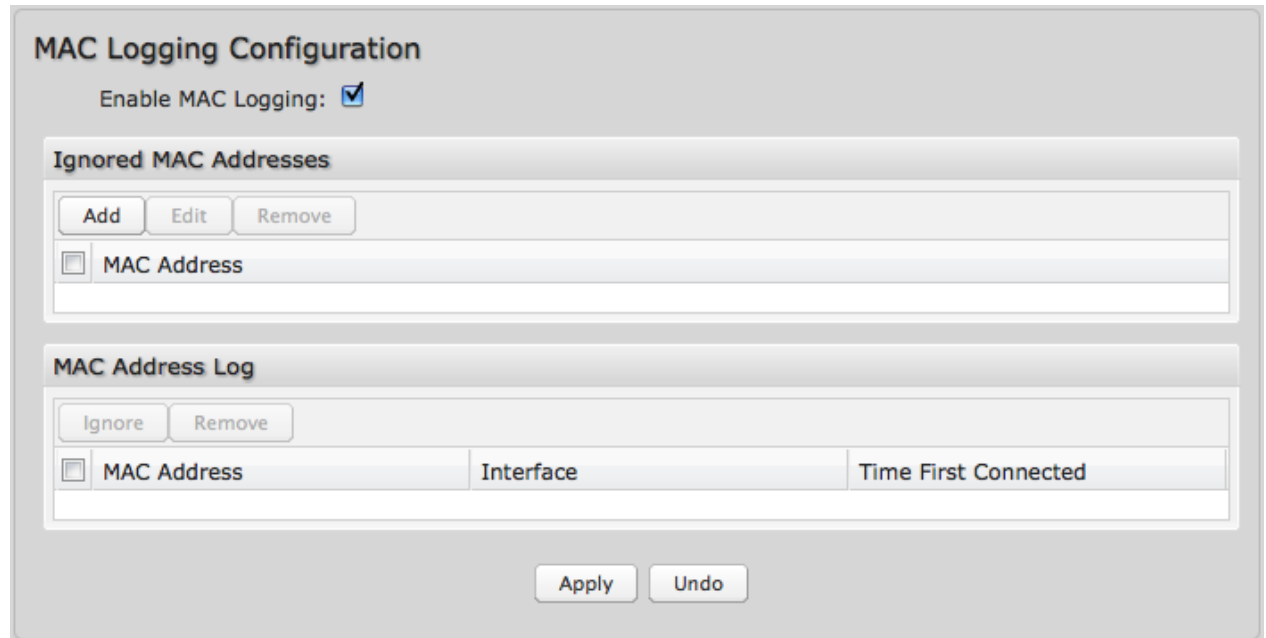

You can configure the router to send an alert if a connected device has a MAC address that the router doesn’t recognize. Go to **System Settings** → **Device Alerts** to set up these email alerts.

**Ignored MAC Addresses:** This is the list of MAC addresses that will not produce an alert or a log entry when they are connected to the router. These should be MAC addresses that you expect to be connected to the router.

To add MAC addresses to this list, simply select devices shown in the MAC Address Log and click “Ignore.” You can also add addresses manually.

**MAC Address Log:** This shows the last 64 MAC addresses that have connected to the router, as well as which interface was used to connect.

The time/date that is logged is the time of the first connection. The page may need to be refreshed to show the most recent log entries.

**MAC Logging Configuration**

Enable MAC Logging:

**Ignored MAC Addresses**

Add Edit Remove

MAC Address
<input type="checkbox"/> MAC Address

**MAC Address Log**

Ignore Remove

MAC Address	Interface	Time First Connected
<input type="checkbox"/> MAC Address		

Apply Undo

## 6.6 Routing

Add a new static route to the IP routing table or edit/remove an existing route.

Static routes are unnecessary for most users.

They are typically only used in networks with more than one layer, such as when there is a

network within a network so that packet destinations are hidden behind an additional router. Adding a static route is a way of telling the router about an additional step that packets will need to take to reach their destination.

Click **Add** to create a new static route.

**IP/Network Address:** The IP address of the target network or host.

**Type:** Select from a dropdown list to specify the type of the target:

- Network
- Host

**Netmask:** The Netmask, along with the IP address, defines the network the computer belongs to and which other IP addresses the computer can see in the same LAN. An IP address of 192.168.0.1 along with a Netmask of 255.255.255.0 defines a network with 256 available IP addresses from 192.168.0.0 to 192.168.0.255.

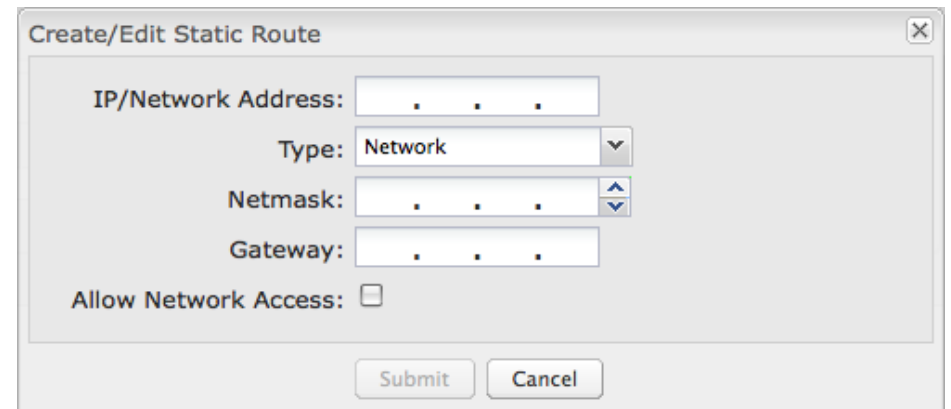

NOTE: 255.255.255.255 is used to signify only the host that was entered in the IP/Network Address field.

**Gateway:** Specifies the next hop to be taken if this route is used. A gateway of 0.0.0.0 implies there is no next hop, and the IP address matched is directly connected to the router on the interface specified: **LAN** or **WAN**.

**Allow Network Access:** (Default: Deselected.) Some static routes will need an IP Filter Rule via the Firewall to allow packets through the route without being blocked. Selecting this option automatically creates this IP Filter Rule. If the **IP/Network Address** falls outside the LAN IP range, you probably need to select this option.

IP/Network Address	Type	Netmask	Gateway

Create/Edit Static Route

IP/Network Address: . . .

Type: Network

Netmask: . . .

Gateway: . . .

Allow Network Access:

Submit Cancel

## 6.7 WiFi / Local Networks

This section is used to configure the settings for networks created by your router. Note that changes made in this section may also need to be duplicated on devices that you want to connect to your networks.

For example, if you change a LAN's IP address, devices within that network will lose connection. They will have to reconnect to the network.

The CBR400 includes these options:

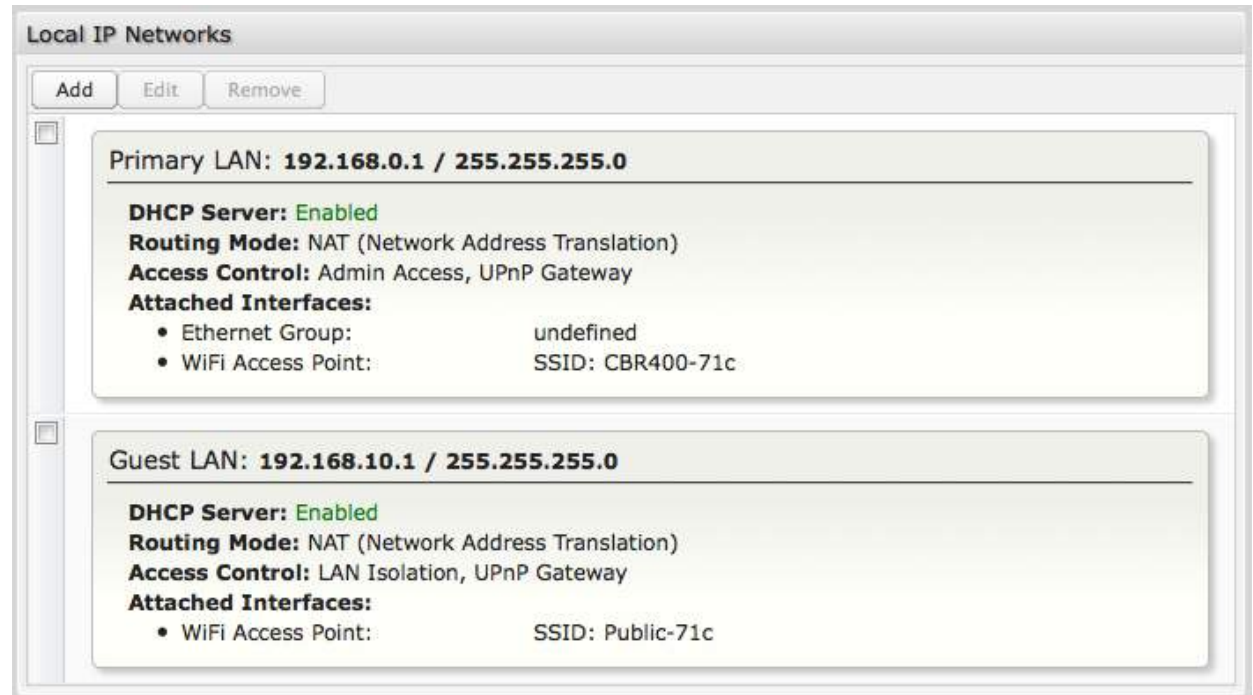

- 2 SSIDS
- VLAN (virtual LAN)
- NAT-less routing

The user can set up multiple networks, each with its own unique configuration and its own selection of interfaces.

Each local network can be attached to any of the following types of interfaces:

- WiFi
- Ethernet
- VLAN

For example, one network might be just an isolated WiFi hotspot for guests, while another might be the main network with administrative access, an Ethernet port, a password-protected WiFi SSID, and a VLAN interface.

### 6.7.1 Local IP Networks

**Local IP Networks** displays the following information for each network:

- **Network Name**
- **IP address/Netmask**
- **DHCP Server** (Enabled/Disabled)
- **Routing Mode** (NAT, Standard, IP Passthrough, Hotspot, Disabled)
- **Access Control** (Admin Access, UPnP Gateway, LAN Isolation)
- **Attached Interfaces** (Ethernet port, WiFi, VLAN)

Primary LAN: **192.168.0.1 / 255.255.255.0**

**DHCP Server:** Enabled

**Routing Mode:** NAT (Network Address Translation)

**Access Control:** Admin Access, UPnP Gateway

**Attached Interfaces:**

- Ethernet Group: undefined
- WiFi Access Point: SSID: CBR400-71c

Click **Add** to configure a new network, or select an existing network and click **Edit** to view configuration options.

### HotSpot (Captive Portal)

When you set a network as a “Hotspot” under **Routing Mode**, you will also need to make sure to:

1) Configure hotspot settings under **System Settings → Hotspot Services**. Click on **Configure** to link to that page.

2) If you want a hotspot that includes WiFi, set one of your WiFi interfaces to “Open” for its Security Mode and attach this interface to your hotspot network. Otherwise guests will need to know the password to connect to the WiFi network even before viewing a Terms of Service page (or other hotspot options).

Finally, make sure your WiFi interface is “Enabled”.

Guest LAN: **192.168.10.1 / 255.255.255.0**

**DHCP Server:** Enabled

**Routing Mode:** HotSpot (Captive Portal) :: [Configure](#)

**Access Control:** LAN Isolation, UPnP Gateway

**Attached Interfaces:**

- WiFi Access Point: SSID: CradlePoint Captive Portal

## 6.7.2 Local Network Editor

The **Local Network Editor** contains the following tabs: IP Settings, Interfaces, Access Control, and DHCP Server.

### **IP Settings:**

**Name:** This primarily helps to identify this network during other administration tasks.

**Hostname:** [Default: cp (for CradlePoint)] The hostname is the DNS name associated with the router's local area network IP address.

**NOTE:** You can access the router's administration pages by typing the hostname into your browser, so if you change "cp" to another hostname, you can access the administration pages through the new hostname.

**IP Address:** This is the address used by the router for local area network communication. Changes to this parameter may require a restart to computers on this network.

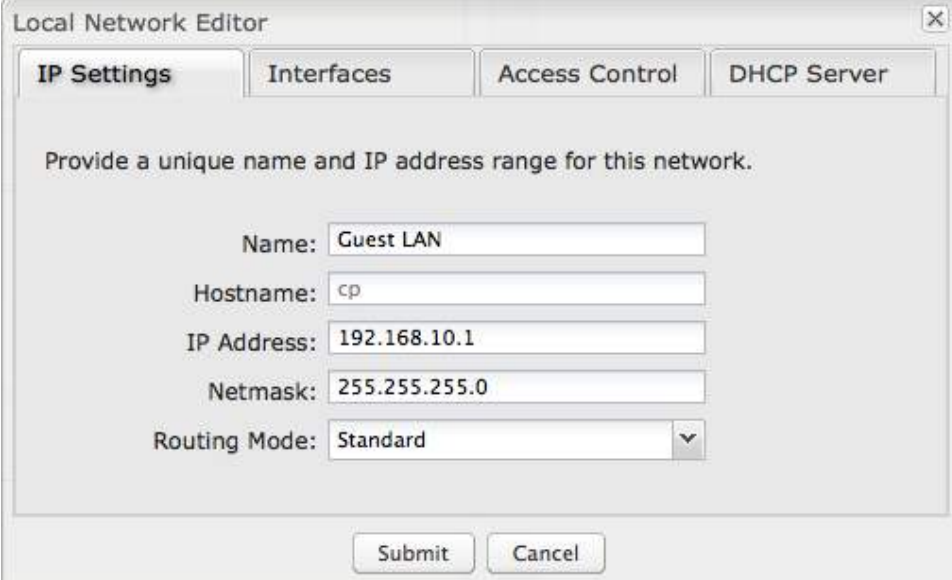

Each network must have a distinct IP address. Most users will want an address from one of the following private IP ranges:

- 10.0.0.1 - 10.255.255.1
- 172.16.0.1 - 172.31.255.1
- 192.168.0.1 - 192.168.255.1

**NOTE:** The final number does not have to be 1, but it is a simple, logical convention for routers that leaves higher numbers free for other devices.

**Netmask:** (Default: 255.255.255.0) The netmask controls how many IP addresses can be used in this network. The default value allows for 254 IP addresses, which is enough in most cases.

**Routing Mode:** (Default: NAT) Each network can use a unique routing mode to connect to the Internet and other local networks. NAT is desirable for most configurations. Select from the following options in the dropdown list:

Local Network Editor

IP Settings | Interfaces | Access Control | DHCP Server

Provide a unique name and IP address range for this network.

Name: Guest LAN

Hostname: cp

IP Address: 192.168.10.1

Netmask: 255.255.255.0

Routing Mode: Standard

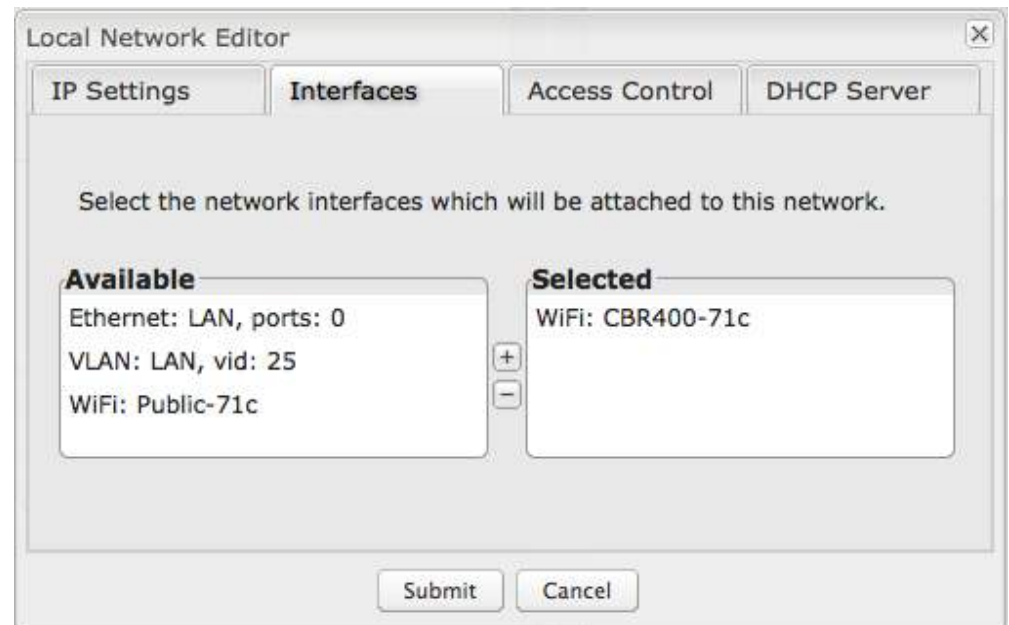

Submit Cancel

- **NAT:** Network Address Translation hides private IP addresses behind the router's IP address. This is the simplest and most common choice for users, because NAT does the translation work for you.
- **Standard:** NAT-less routing. If you select **Standard**, you must separately configure your IP addresses so that they will be publically accessible. Typically you will not select this option unless you have a specific reason to bypass NAT.
- **IP Passthrough:** IP Passthrough passes the IP address given by the modem WAN through the router. The Ethernet port must be in LAN mode or Disabled mode, and Hotspot, VPN, and GRE must be disabled.
- **Hotspot:** Provide Hotspot Services on this network, requiring Terms of Service or RADIUS/UAM authentication before WAN access will occur on both wireless and wired LAN connections. To enable a Hotspot you must also configure your Hotspot settings under **System Settings → Hotspot Services**.
- **Disabled:** Disable this network.

### **Interfaces:**

Select network interfaces to attach to this network. Choose from WiFi, Ethernet ports, and VLAN interfaces. Double-click on any of the interfaces shown on the left in the **Available** section to move them to the **Selected** section on the right (or highlight an interface and click the + button). To deselect an interface, double-click on an interface in the **Selected** section (or highlight the interface and click the – button).

If you want more interface options, you must configure additional WiFi, Ethernet ports, and VLAN interfaces separately. See the **Local Network Interfaces** section below (on this same administration page: **Network Settings → WiFi / Local Networks**).

### **Access Control:**

Tune the access control settings of this network to match the intended use. Simply select or deselect any of the following:

- **LAN Isolation:** When checked, this network will NOT be allowed to communicate with other local networks.
- **UPnP Gateway:** Select the UPnP (Universal Plug and Play) option if you want to enable the UPnP Gateway service for computers on this network.
- **Admin Access:** When enabled, users may access these administration pages on this network.

The image shows a screenshot of the 'Local Network Editor' dialog box. It has four tabs: 'IP Settings', 'Interfaces', 'Access Control', and 'DHCP Server'. The 'Access Control' tab is selected. Below the tabs, there is a heading: 'Tune the access control settings of this network to match the intended use.' Below this heading are three settings, each with a checkbox:

- LAN Isolation:
- UPnP Gateway:
- Admin Access:

At the bottom of the dialog box are two buttons: 'Submit' and 'Cancel'.

**DHCP Server:**

Changing settings for the DHCP server is optional. The default selections are almost always sufficient.

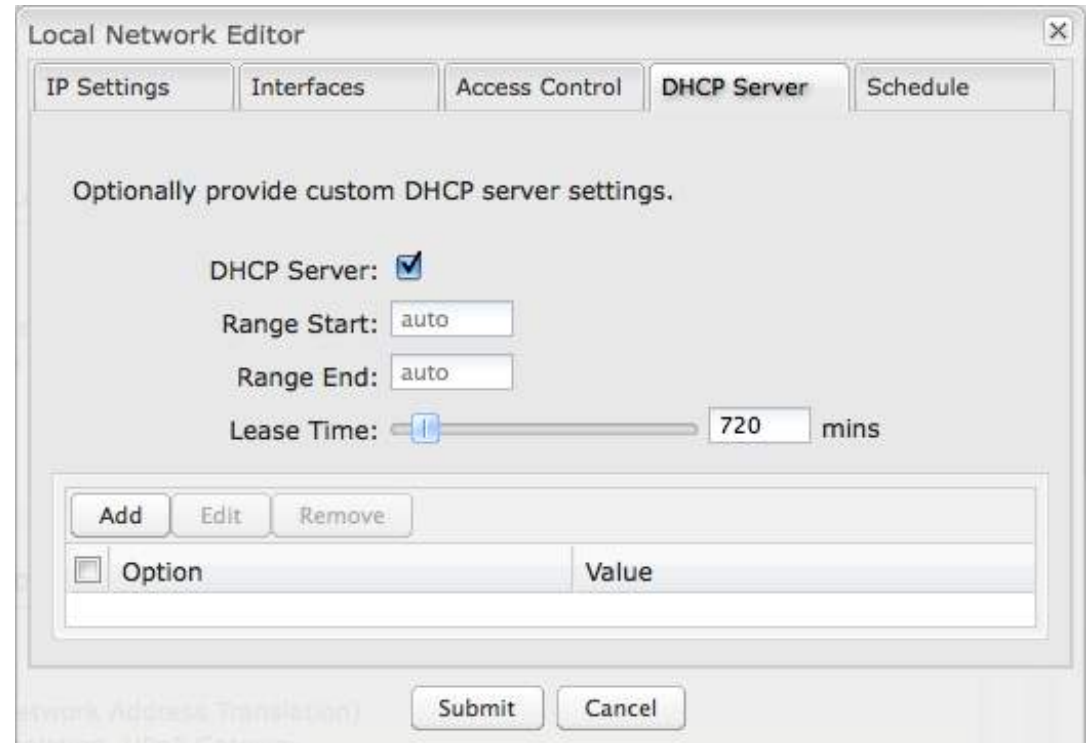

**DHCP Server:** (Default: Enabled) When the DHCP server is enabled, users of your network will be able to automatically connect to the Internet without any special configuration. **It is recommended that you leave this enabled.** Disabling the DHCP server is only recommended if you have another DHCP server on your network and it is configured properly.

**Range Start and Range End:** These designate the range of values in the reserved pool of IP addresses for the DHCP server. Values within this range will be given to any DHCP enabled computers on your network. The default values are almost always sufficient (default: 72 to 200, as in 192.168.0.72 to 192.168.0.200).

Example: The CBR400 uses an IP address of 192.168.0.1 for its primary network by default. A computer designated as a Web server has a static IP address of 192.168.0.3. Another computer is designated as an FTP server with a static IP address of 192.168.0.4. The starting IP address for the DHCP server needs to be 192.168.0.5 or higher.

**Lease Time:** [Default: 720 minutes (12 hours)] The lease time specifies how long DHCP-enabled computers will wait before requesting a new DHCP lease. Smaller values are better suited to busy environments.

**DHCP Options:** Input a custom DHCP option by first clicking “Add”. There are close to 200 possible DHCP options available. One of the more common uses is to assign a VoIP phone server using option 66 (Server name).

**Option:** Select an option from the dropdown list or manually enter the number of an option. A [complete list of options](#) is available from IANA.

**Value:** Generally this field should be a string, IP address, or numeric value. Some fields can accept both IP addresses and hostnames—in these cases you may need to wrap this value in quotes. For example, option 66 (Server name) requires quotes around IP addresses.

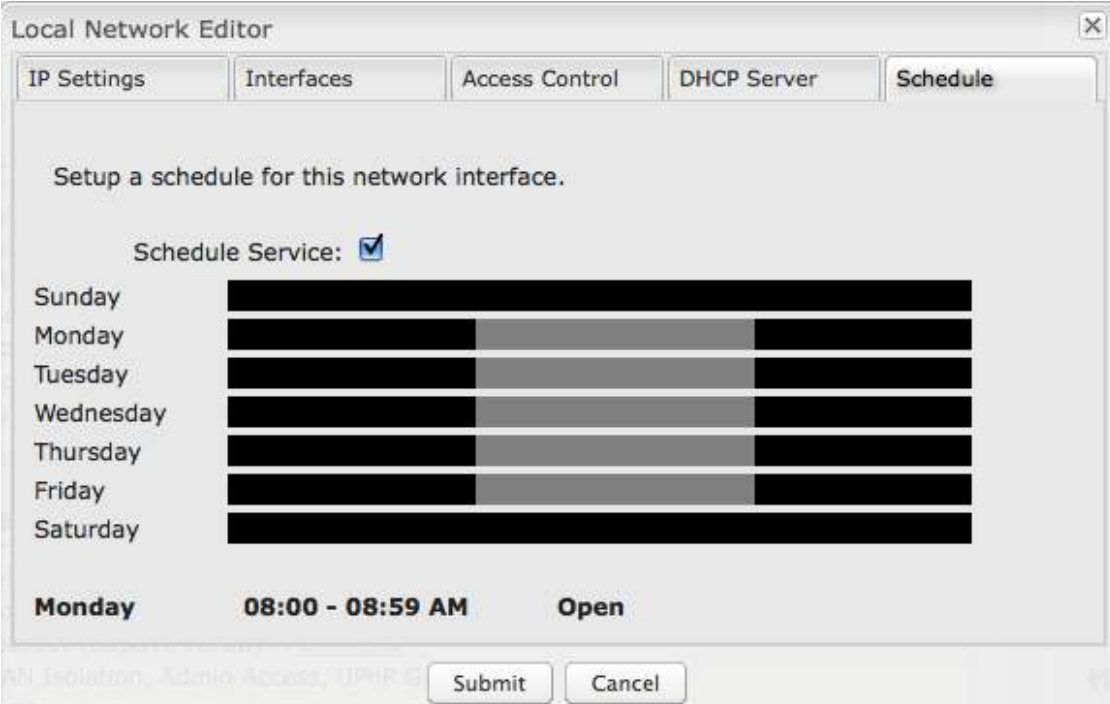

### **Schedule:**

Set up a schedule for this network interface. This allows an interface to be enabled or disabled during specific hours of a day. For example, use this to limit a Hotspot network to business hours.

**Schedule Service:** (Default: Disabled.) Select to enable. This will open a configurable chart for setting the schedule.

Each hour of the week is represented by a black or gray square. Black represents disabled, while gray represents enabled. Hover over a square to reveal the hour it represents. Click on the squares to toggle between black and gray.

In the example shown, the network is enabled from 9-5 on Monday through Friday, but disabled at all other times.

Local Network Editor

IP Settings | Interfaces | Access Control | DHCP Server | **Schedule**

Setup a schedule for this network interface.

Schedule Service:

Sunday	Black	Black	Black
Monday	Black	Gray	Black
Tuesday	Black	Gray	Black
Wednesday	Black	Gray	Black
Thursday	Black	Gray	Black
Friday	Black	Gray	Black
Saturday	Black	Black	Black

**Monday**      **08:00 - 08:59 AM**      **Open**

Submit      Cancel

### 6.7.3 Local Network Interfaces

Each LAN type—WiFi, Ethernet, and VLAN—has a separate section with configuration options. Unless the default configuration is sufficient, **YOU MUST CONFIGURE EACH INTERFACE SEPARATELY** in order to create the desired interface options for a network. You can then select these interfaces to add to a network in the **Local Network Editor** (see above).

Select from the following tabs:

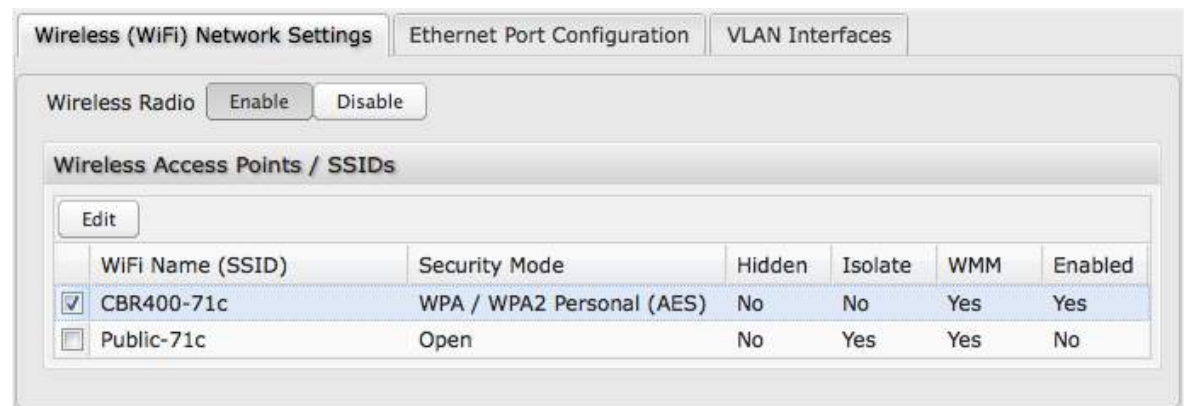

- **Wireless (WiFi) Network Settings**
- **Ethernet Port Configuration**
- **VLAN Interfaces**

#### Wireless (WiFi) Network Settings

The CBR400 can broadcast two SSIDs (service set identifiers — the names for WiFi networks). One primary WiFi network is enabled by default, while you may have enabled a second guest network when using the First Time Setup Wizard. You have the ability to change the settings for either of these networks.

**Wireless Radio:** Enable/Disable. (Default: Enabled). Leave enabled unless you don't want any WiFi networks broadcast from your router.

Select a WiFi network and click **Edit** to change the settings.

## **Wireless Network Editor**

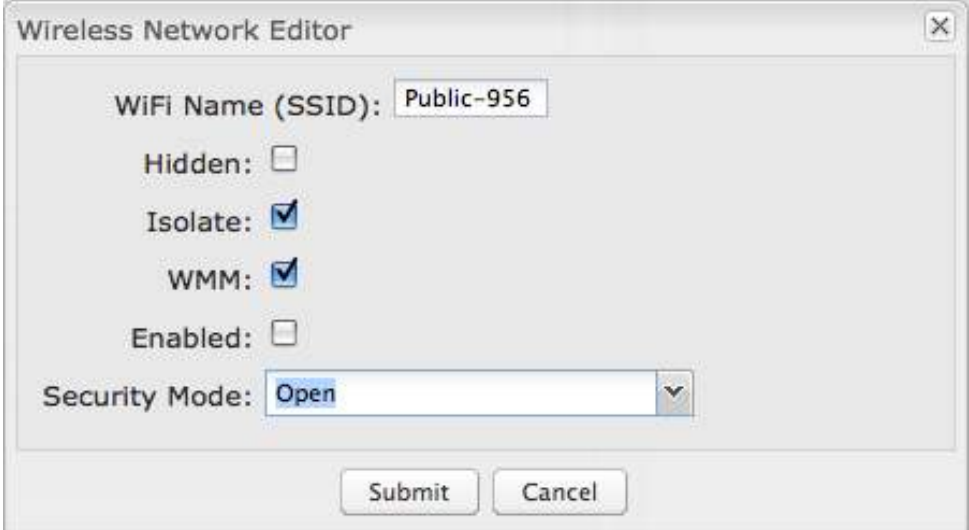

**WiFi Name (SSID):** When you are browsing for available wireless networks, this is the name that will be broadcast from this router for the selected network. This name is referred to as the SSID (service set identifier). For security purposes, CradlePoint highly recommends that you change this from the pre-configured name.

**Hidden:** This shows whether the router broadcasts its SSID. It is somewhat harder for hackers to find and attack a router that is not broadcasting its SSID, which adds to the wireless security, but it is also more difficult for friendly users to attach to a WiFi network with a hidden SSID.

**Isolate:** Select this to isolate all wireless clients so they cannot directly communicate with each other on the wireless network.

**WMM:** WiFi Multimedia. This is a basic traffic shaping, or QoS (quality of service), system for the network. WMM works behind the scenes to set priorities for different types of traffic on your network. For example, video streams are given higher priority than print jobs, since video streams need consistent throughput.

**Enabled:** If the network is available.

The screenshot shows a dialog box titled "Wireless Network Editor" with a close button (X) in the top right corner. The dialog contains the following fields and options:

- WiFi Name (SSID):** A text input field containing "Public-956".
- Hidden:** A checkbox that is unchecked.
- Isolate:** A checkbox that is checked.
- WMM:** A checkbox that is checked.
- Enabled:** A checkbox that is unchecked.
- Security Mode:** A dropdown menu currently showing "Open".

At the bottom of the dialog are two buttons: "Submit" and "Cancel".

**Security Mode:** You have several options for selecting a security mode. The mode you choose depends on the security features your wireless adapters support.

- WPA2 Personal
- WPA / WPA2 Personal
- WPA Personal
- WPA2 Enterprise
- WPA / WPA2 Enterprise
- WPA Enterprise
- WEP Auto
- Open

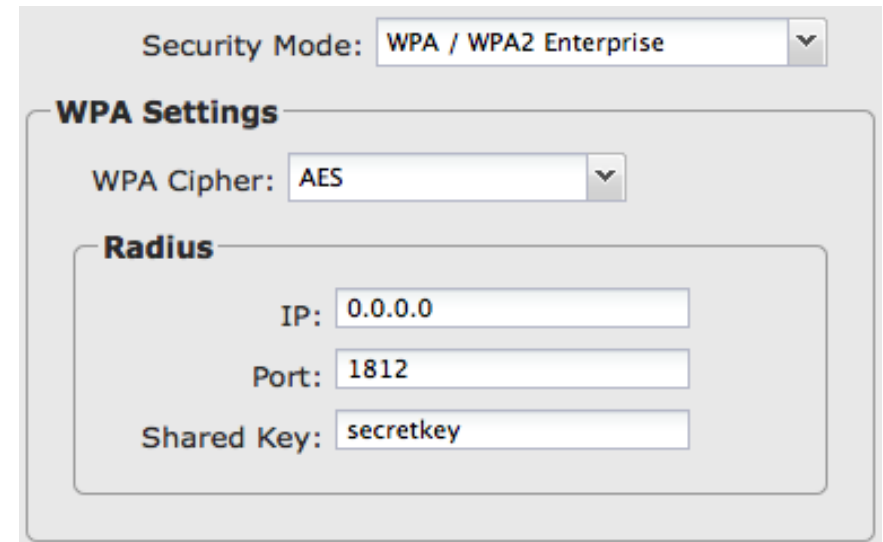

Select “Open” to create a hotspot: otherwise select the best security that your devices will support (CradlePoint recommends WPA2).

Depending on which Security Mode you select, there are different setup options.

- “**Personal**” security modes require passwords.
- “**Enterprise**” security modes are linked to a RADIUS server and require RADIUS authentication: **IP**, **Port**, and **Shared Key**.
- “**WPA2**” (Personal or Enterprise) forces AES as the WPA Cipher.
- “**WPA/WPA2**” and “**WPA**” (Personal or Enterprise) allow AES, TKIP/AES, and TKIP.
- “**WEP Auto**” requires a WEP Key.
- “**Open**” has no password or other security measures.

NOTE: If you don’t know whether you should choose Personal or Enterprise, assume Personal since you need to know RADIUS authentication for Enterprise.

In order to protect your network from hackers and unauthorized users, CradlePoint highly recommends **WPA2/AES** for security if your attached devices can support it. WEP and WPA/TKIP are obsolete and have been replaced by WPA/AES. Using those security settings will cause the WiFi to limit to 802.11g modes.

Security Mode: WPA / WPA2 Enterprise

**WPA Settings**

WPA Cipher: AES

**Radius**

IP: 0.0.0.0

Port: 1812

Shared Key: secretkey

NOTE: If you select one of the security modes and are unable to connect to the router afterwards, you can use the reset buttons to reset the router to its factory default state and try a different security mode instead.

## Ethernet Port Configuration

Ethernet Port Configuration provides controls for your router's Ethernet port. You have the ability to control: **Mode** (WAN or LAN) and **Link Speed**. Additional controls for WAN ports are available in [Internet](#) → [Ethernet Settings](#).

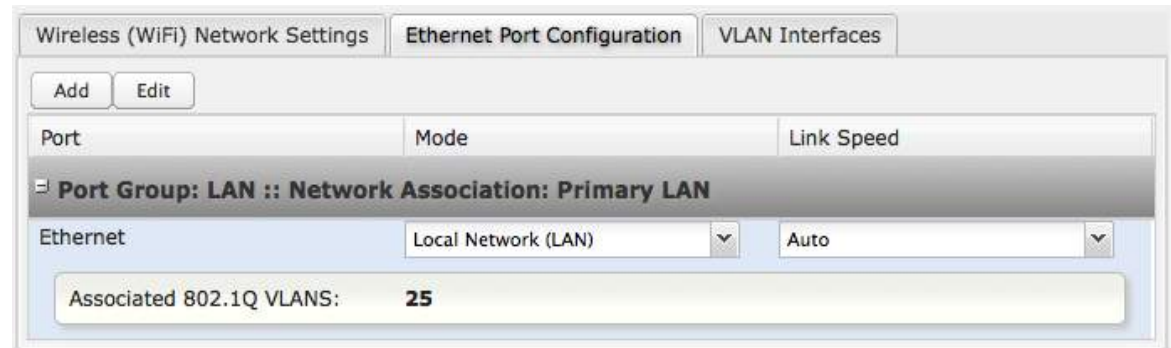

**Mode:** WAN or LAN. Default setting is LAN (Local Area Network).

- **Internet (WAN)** is used to connect to another network such as a hotel or office wired network. The WAN connection is used as a possible source of Internet for the CBR400.
- **Local Network (LAN)** is for connecting a computer or similar device directly to the router with an Ethernet cable.

NOTE: When a port group uses the LAN mode you must separately ensure that this logical interface is attached to a **Local IP Network** in the top panel of this page.

**Link Speed:** Default setting is Auto. The Auto setting is preferred in most cases.

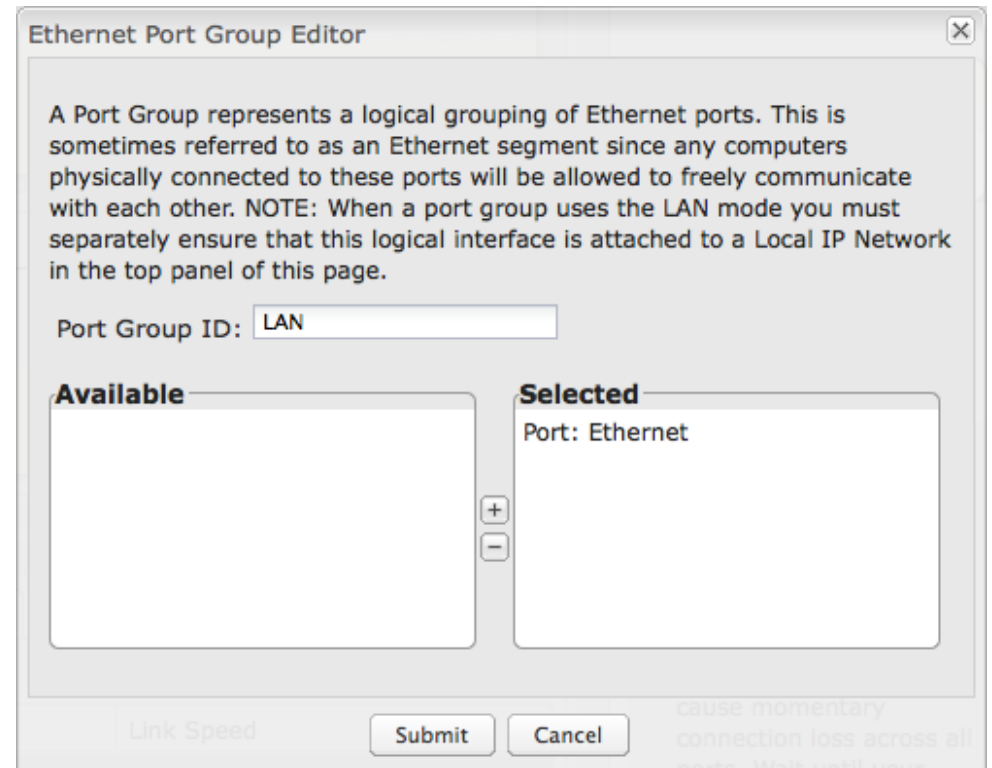

- Auto
- 10Mbps - Half Duplex
- 10Mbps - Full Duplex
- 100Mbps - Half Duplex
- 100Mbps - Full Duplex
- 1000Mbps - Full Duplex

## Ethernet Port Group Editor

Port groups are less relevant for the CBR400 than for some other CradlePoint routers because it has only one port. However, you can still change the port group ID for your Ethernet port.

**Port Group ID:** The Port Group ID field provides a reference for a port group to be used in other parts of the router configuration. For example, this ID is referenced in the **Local IP Networks** configuration to attach this Ethernet port with a network configuration. Use a simple short text phrase to describe this port group, such as "main", "guestport", "LAN", etc.

Ethernet Port Group Editor

A Port Group represents a logical grouping of Ethernet ports. This is sometimes referred to as an Ethernet segment since any computers physically connected to these ports will be allowed to freely communicate with each other. NOTE: When a port group uses the LAN mode you must separately ensure that this logical interface is attached to a Local IP Network in the top panel of this page.

Port Group ID: LAN

Available

Selected

Port: Ethernet

cause momentary connection loss across all ports. Wait until your

## VLAN Interfaces

A virtual local area network, or VLAN, functions as any other physical LAN, but it enables computers and other devices to be grouped together even if they are not physically attached to the same network switch.

To enable a VLAN, select a VID (virtual LAN ID) and a group of Ethernet ports through which users can access the VLAN. Then go back up to the **Local Network Editor** to attach your new VLAN to a network. To use a VLAN, the VID must be shared with another router or similar device so that multiple physical networks have access to the one virtual network.

Click **Add** to create a new VLAN interface.

### VLAN Editor

**VID:** An integer value that is the Virtual LAN ID.

**Ethernet Group:** Select the LAN ports with which you want to associate the VLAN ID from a dropdown list. Your Ethernet group must be created separately under **Ethernet Port Configuration**.

Click **Submit** to save your configured VLAN.

Wireless (WiFi) Network Settings			Ethernet Port Configuration			VLAN Interfaces		
<input type="button" value="Add"/> <input type="button" value="Edit"/> <input type="button" value="Remove"/>								
<input type="checkbox"/>	VID		Ethernet Group			Network Association		
<input type="checkbox"/>	25		ID: LAN, Port(s): 0			Primary LAN		

**VLAN Editor** ✕

VID:

Ethernet Group:

#### 6.7.4 WiFi Settings

When you select the **Wireless (WiFi) Networks Settings** tab in the **Local Network Interfaces** section, you have several additional options for configuring your wireless LANs under the **WiFi Settings** heading.

**Random Channel:** Select to randomize the WiFi channel. This makes it less likely that the wireless signal from this router will conflict with another router in the same area.

**Optimize WiFi/WiMAX coexistence:** (Shows if **Random Channel** is selected) Setting this will lessen any possible conflict with WiFi and an attached WiMAX modem. If a WiMAX modem is attached to the router when the WiFi is enabled, the WiFi channel and transmit power will be set to levels that optimize the performance of the WiMAX modem. If no WiMAX modem is attached, then default channel and power settings will be used even if this is selected.

**ADVANCED**  
**WiFi Settings**

Random Channel:

Channel: 1 (2412 MHz)

Client Timeout: 300

TX Power:  100 %

RTS Threshold:  2347 bytes

Fragmentation Threshold:  2346 bytes

DTIM:  1

Beacon:  100 ms

WPS:

Short Slot:

Wireless Mode: 802.11 b/g/n

Channel Width: 20 MHz

Extended Channel: Above

MCS: Auto

Short GI:

Greenfield Mode:

RADIUS Timeout: 3600

RADIUS Retry: 60

**Channel:** (Shows if **Random Channel** is deselected.) The WiFi channel corresponds to a frequency the router uses to communicate with other devices. The range is 1 to 11, and 1, 6, and 11 do not overlap each other. If a WiMAX modem is attached, a higher number channel will increase the chance the router's WiFi and modem's WiMAX radios will conflict with each other, which may result in lower throughput. Select a channel from the dropdown list:

- 1 (2412 MHz)
- 2 (2417 MHz)
- 3 (2422 MHz)
- 4 (2427 MHz)
- 5 (2432 MHz)
- 6 (2437 MHz)
- 7 (2442 MHz)
- 8 (2447 MHz)
- 9 (2452 MHz)
- 10 (2457 MHz)
- 11 (2462 MHz)

**Client Timeout:** If the access point is not able to communicate with the client it will disconnect it after this timeout (in seconds).

**TX Power:** Normally the wireless transmitter operates at 100% power. In some circumstances, however, there might be a need to isolate specific frequencies to a smaller area. By reducing the power of the radio, you can prevent transmissions from reaching beyond your corporate/home office or designated wireless area.

**RTS Threshold:** When an excessive number of wireless packet collisions are occurring, wireless performance can be improved by using the RTS/CTS (Request to Send/Clear to Send) handshake protocol. The wireless transmitter will begin to send RTS frames (and wait for CTS) when data frame size in bytes is greater than the RTS Threshold. This setting should remain at its default value.

**Fragmentation Threshold:** Wireless frames can be divided into smaller units (fragments) to improve performance in the presence of RF interference and at the limits of RF coverage. Fragmentation will occur when frame size in bytes is greater

than the Fragmentation Threshold. This setting should remain at its default value. Setting the Fragmentation value too low may result in poor performance.

**DTIM:** A DTIM is a countdown informing clients of the next window for listening to broadcast and multicast messages. When the wireless router has buffered broadcast or multicast messages for associated clients, it sends the next DTIM with a DTIM Interval value. Wireless clients detect the beacons and awaken to receive the broadcast and multicast messages. The default value is 1. Valid settings are between 1 and 255.

**Beacon:** Beacons are packets sent by a wireless router to synchronize wireless devices. Specify a Beacon Period value between 20 and 1000 milliseconds.

**WPS:** WiFi Protected Setup is a method for easy and secure establishment of a wireless network. It can be used instead of passwords when connecting clients that support WPS.

**Short Slot:** Slot Time is the period wireless clients use in determining if the channel is free for transmission. Enabling this value allows clients that can utilize a shorter time to do so. Disabling this option forces all clients to use a longer backoff check and thus may reduce network throughput while reducing the number of transmission collisions.

**Wireless Mode:** Select the WiFi clients the router will be compatible with. Greater compatibility is a tradeoff with better performance. For greatest compatibility with all WiFi devices, select "802.11 b/g/n". For best performance, connect with only other 802.11n-compatible devices and select "802.11 n."

- 802.11 b
- 802.11 b/g
- 802.11 b/g/n
- 802.11 n

**Channel Width:** Selects whether the router uses a single 20 MHz channel to send/receive, or uses two adjacent 20 MHz channels to create a 40 MHz channel. Higher performance is possible with the 40 MHz channel. Selecting Auto is generally best. Enabling WiFi as WAN will force 20 MHz only mode.

**Extended Channel:** When operating in 40 MHz mode the access point will use an extended channel either below or above the current channel. Optimal selection will depend on the channels of other networks in the area.

**MCS:** 802.11n uses multiple Modulation Coding Schemes to enable higher throughput in various environments. Since clients can dynamically change rates depending on environment, selecting **Auto** is generally best.

**Short GI:** Short GI is an optimization for shortening the interval between transmissions. May be incompatible with older clients.

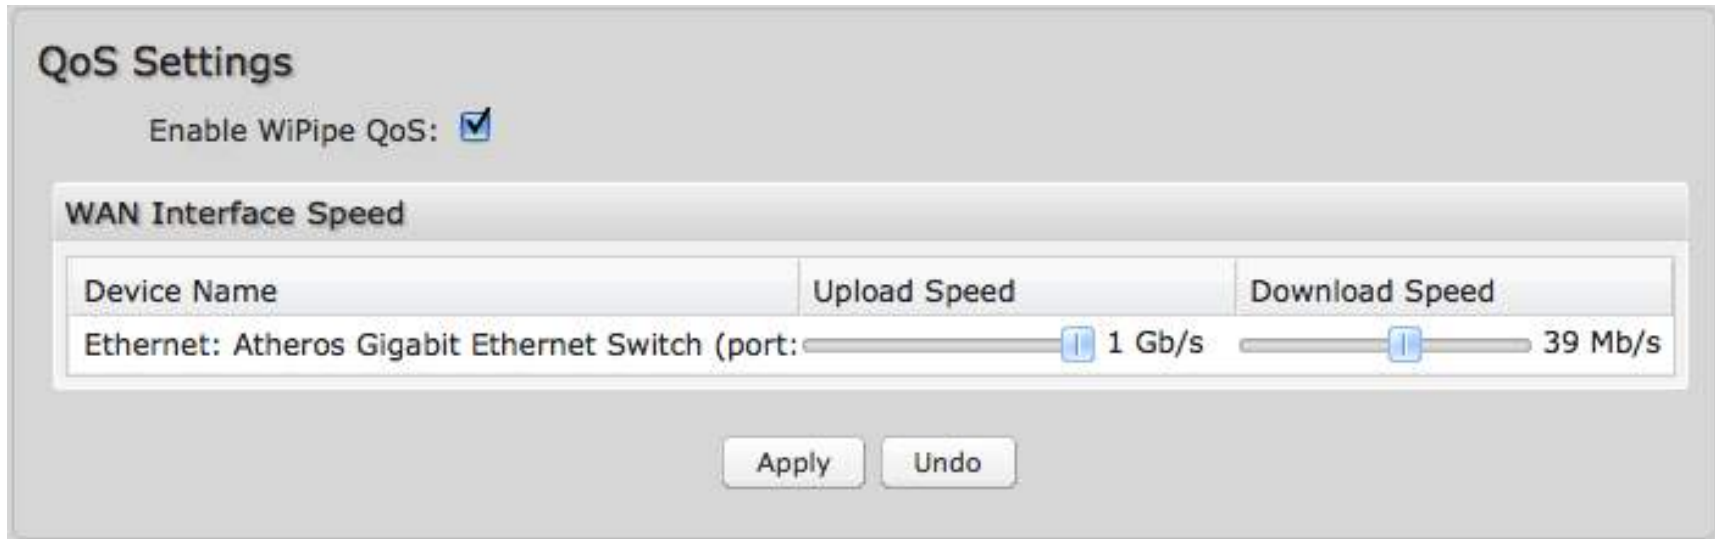

**Greenfield Mode:** Greenfield mode uses an 802.11n-only preamble to transmit packets that older wireless clients cannot interpret. Use of greenfield mode in a mixed 802.11 environment may result in degraded performance but can improve performance if all devices in the area are 802.11n compatible.

**RADIUS Timeout:** (Default: 3600 seconds) When using an Enterprise security mode clients will be forced to re-authenticate with the RADIUS server at this interval in seconds. This allows administrators to revoke access so when an attached client's authentication expires, the client must re-authenticate.

**RADIUS Retry:** (Default: 60 seconds) When using an Enterprise security mode, if a RADIUS query fails to receive a response from the server it will delay by this interval (in seconds) before attempting another query. This helps protect the network from floods of authentication requests if the RADIUS server is temporarily unreachable.

## 6.8 WiPipe QoS

When WiPipe QoS (Quality of Service, also known as “Traffic Shaping”) is enabled, the router will control the flow of Internet traffic according to the user-defined rules. In other words, Traffic Shaping improves performance by allowing the user to prioritize applications.

**QoS Settings**

Enable WiPipe QoS:

**WAN Interface Speed**

Device Name	Upload Speed	Download Speed
Ethernet: Atheros Gigabit Ethernet Switch (port: ...)	1 Gb/s	39 Mb/s

Apply Undo

**Enable WiPipe QoS:** Click on this box to open options for controlling Internet traffic. You can assign maximum Upload Speed and Download Speed values and define your own Traffic Shaping rules.

**Upload Speed and Download Speed:** Setting the **Upload Speed** and **Download Speed** is required to control traffic flow accurately. Adjust the sliding bar to restrict the maximum upload and/or download speed for the Internet source(s) you are using. For example, you might restrict the upload speed to prioritize available bandwidth for download or to reduce overall bandwidth use in order to lower costs. It is recommended that you experiment with different values for your particular Internet connection for best results.

NOTE: Upload speed is the speed at which data can be transferred to your ISP. Download speed is the speed at which data can be transferred to you from your ISP. You can test your connection speeds with a service such as [speedtest.net](http://speedtest.net).

### 6.8.1 Traffic Shaping Rules

A Traffic Shaping rule identifies a specific message flow and assigns a priority to that flow. Assign rules based on upload/download bandwidth, protocol, port numbers, and/or IP addresses.

EXAMPLE: You can restrict the bandwidth of your guest network in order to reserve crucial bandwidth for your primary network. Create a rule associated with the IP address range and appropriate netmask for the guest network. Then set upload/download bandwidth limits as a percentage of your available bandwidth.

<span>Add</span> <span>Edit</span> <span>Remove</span>								
	Rule Name	Upload Bandwidth	Upload Priority	Download Bandwidth	Download Priority	Enabled		
↓	guest	10% (borrows)	Lower	25% (borrows)	Normal	Yes		
<table border="0"> <tr> <td style="vertical-align: top;"> <p><b>Traffic Source:</b>                      IP Address: 192.168.10.0                      Netmask: 255.255.255.0                      Any Port                      Protocol: any</p> </td> <td style="vertical-align: top;"> <p><b>Traffic Destination:</b>                      Any IP Address                      Any Port</p> </td> </tr> </table>							<p><b>Traffic Source:</b>                      IP Address: 192.168.10.0                      Netmask: 255.255.255.0                      Any Port                      Protocol: any</p>	<p><b>Traffic Destination:</b>                      Any IP Address                      Any Port</p>
<p><b>Traffic Source:</b>                      IP Address: 192.168.10.0                      Netmask: 255.255.255.0                      Any Port                      Protocol: any</p>	<p><b>Traffic Destination:</b>                      Any IP Address                      Any Port</p>							
↑	primary	30% (borrows)	High	70% (borrows)	High	Yes		

Traffic Shaping supports overlap between rules, where more than one rule can match for a specific message flow. If more than one rule matches, the rule with the highest priority will be used.

Click **Add** to create a new Traffic Shaping rule.

## **Traffic Shaping / QoS Rule Editor**

The first page of the Traffic Shaping / QoS Rule Editor allows you enable/disable the rule, name the rule, and specify a protocol for the rule.

**Rule Enabled:** (Default: Enabled.) Deselect this to disable this rule. This can be useful for quickly changing configurations. If both upload QoS and download QoS are disabled then the rule will disable automatically.

**Rule Name:** Create a name and/or description for the rule that is meaningful to you.

**Protocol.** The protocol used by the messages: TCP, UDP, or ICMP. Select “Any” if your rule does not control a specific type of message that uses a specific protocol.

Click **Next** to continue to the next page.

Add Traffic Shaping / QoS Rule

Rule Enabled:

Rule Name:

Protocol:

Back Next Finish

**Enable Upload QoS:** (Default: Enabled.) Deselect if you want your rule to apply to download traffic only.

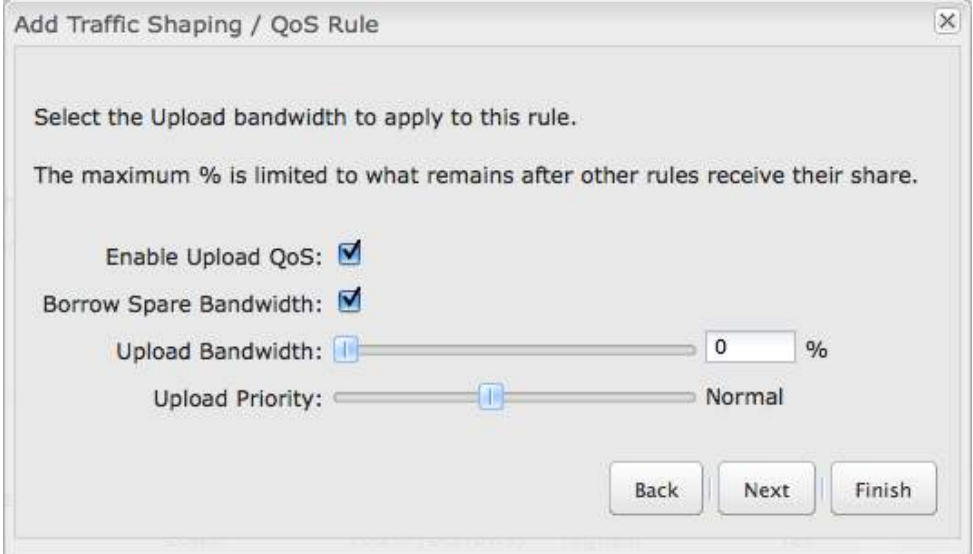

**Borrow Spare Bandwidth:** (Default: Enabled.) When this is enabled, the interfaces/protocols associated with this rule will borrow unused bandwidth from other rules. Disabling borrowing will restrict the traffic to the specified bandwidth. Higher priority queues will be offered excess bandwidth first.

**Upload Bandwidth:** This is the percentage of the connected WAN upload bandwidth that will be reserved for the specified traffic. The maximum value is adjusted to the remaining percentage after other rules receive their share. (For example, if one rule reserves 10% of bandwidth for VoIP, the next rule will be limited to a maximum of 90%.)

**Upload Priority:** The priority value has two different effects on traffic. Higher priority traffic is handled before lower priority traffic, which can lead to shorter response times. Additionally, when spare bandwidth is available it is offered to higher priority classes first. Move the slider to select from the following options (Default: Normal):

- Lowest
- Lower
- Below Normal
- Normal
- Above Normal
- High
- Higher
- Highest

Click **Next** to continue to the next page.

Add Traffic Shaping / QoS Rule

Select the Upload bandwidth to apply to this rule.

The maximum % is limited to what remains after other rules receive their share.

Enable Upload QoS:

Borrow Spare Bandwidth:

Upload Bandwidth:  %

Upload Priority:

Back Next Finish

**Enable Download QoS:** (Default: Enabled.) Deselect if you want your rule to apply to upload traffic only.

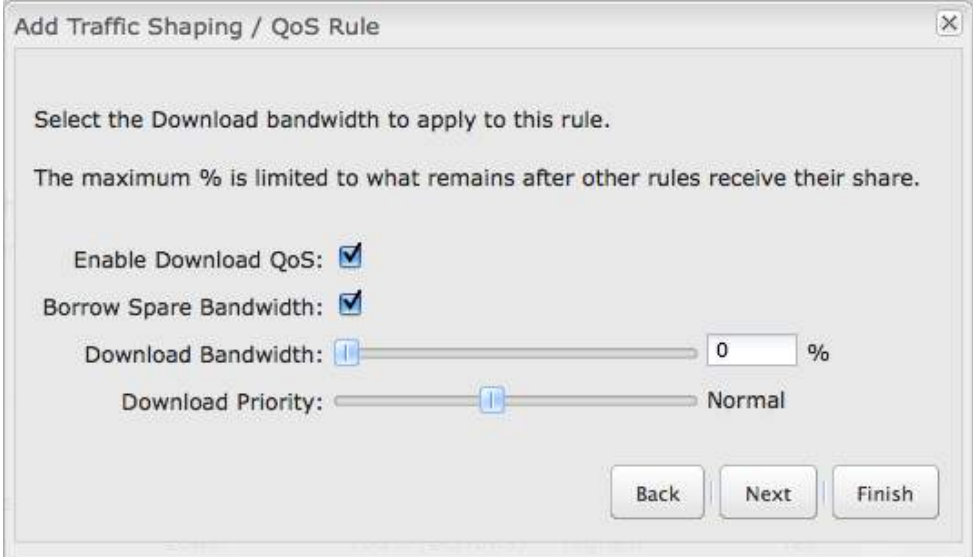

**Borrow Spare Bandwidth:** (Default: Enabled.) When this is enabled, the interfaces/protocols associated with this rule will borrow unused bandwidth from other rules. Disabling borrowing will restrict the traffic to the specified bandwidth. Higher priority queues will be offered excess bandwidth first.

**Download Bandwidth:** This is the percentage of the connected WAN upload bandwidth that will be reserved for the specified traffic. The maximum value is adjusted to the remaining percentage after other rules receive their share. (For example, if one rule reserves 10% of the bandwidth for VoIP, the next rule will be limited to a maximum of 90%.)

**Download Priority:** The priority value has two different effects on traffic. Higher priority traffic is handled before lower priority traffic, which can lead to shorter response times. Additionally, when spare bandwidth is available it is offered to higher priority classes first. Move the slider to select from the following options (Default: Normal):

- Lowest
- Lower
- Below Normal
- Normal
- Above Normal
- High
- Higher
- Highest

Click **Next** to continue to the next page.

**Source Port(s)** and/or **Destination Port(s)**: Enter a port number between 1 and 65535. To enter a single port number, input the number into the left box. To enter a range of ports, fill in both boxes separated by the colon. For example "80:90" would represent all ports between 80 and 90 including 80 and 90 themselves.

**Source IP Address, Source Netmask, Destination IP Address, and Destination Netmask**: Specify an IP address or range of IP addresses by combining an IP address with a netmask for either "source" or "destination" (or both). Source vs. destination is defined by traffic flow. Leave these blank to include all IP addresses (such as if your rule is defined by a particular port instead).

EXAMPLE: If you want to associate this rule with your guest LAN, you could input the IP address and netmask for the guest LAN here (leaving the last slot "0" to allow for any user attached to the guest network):

- **Source IP Address:** 192.168.10.0
- **Source Netmask:** 255.255.255.0

Click **Finish** to save this rule.

The screenshot shows a dialog box titled "Add Traffic Shaping / QoS Rule". It contains the following fields and controls:

- Source Port(s):** Two input boxes separated by a colon, with a dropdown arrow on the right.
- Source IP Address:** An input box with three dots as placeholders.
- Source Netmask:** An input box with three dots as placeholders and a dropdown arrow on the right.
- Destination Port(s):** Two input boxes separated by a colon, with a dropdown arrow on the right.
- Destination IP Address:** An input box with three dots as placeholders.
- Destination Netmask:** An input box with three dots as placeholders and a dropdown arrow on the right.
- At the bottom right, there are three buttons: "Back", "Next", and "Finish".

## 7 INTERNET

The Internet tab provides access to 6 submenu items for managing a variety of Internet connection options.

- Connection Manager
- Data Usage
- GRE Tunnels
- VPN Tunnels
- WiFi as WAN / Bridge
- WAN Affinity

wiipe.

## 7.1 Connection Manager

The router can establish an uplink via the Ethernet WAN port, WiFi as WAN, or modems plugged into a modem port. If the primary WAN connection fails the router will automatically attempt to bring up a new link on another device. This feature is called failover. If Load Balance is enabled, multiple WAN devices may be plugged in and each may establish a link.

### 7.1.1 WAN Interfaces

This is a list of the available interfaces used to access the Internet. You can enable, stop, or start devices from this section. By using the priority arrows (the arrows in the boxes to the left—these show if you have more than one available interface), you can set the interface the router uses by default and the order that it allows failover.

WAN Interfaces				
		( ordered by failover priority )		
	Device	State	Load Balance <input checked="" type="checkbox"/>	Enabled <input checked="" type="checkbox"/>
↓	Ethernet: Blue	Unplugged	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
↑	LTE: PANTECH UML290	Connected	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

In the example shown, Ethernet is set as the primary Internet source, while a USB modem is attached for failover. The Ethernet is “Unplugged” while the modem is “Connected.”

**Load Balance:** If this is enabled, the router will use multiple WAN interfaces to increase the data transfer throughput by using any connected WAN interface consecutively. Selecting Load Balance will automatically start the WAN interface and add it to the pool of WAN interfaces to use for data transfer. Turning off Load Balance for an active WAN interface may require the user to restart any current browsing session.

**Enabled:** Selected by default. Deselect to disable an interface.

Click on the small box at the top of the list to select/deselect all devices for either **Load Balance** or **Enabled**.

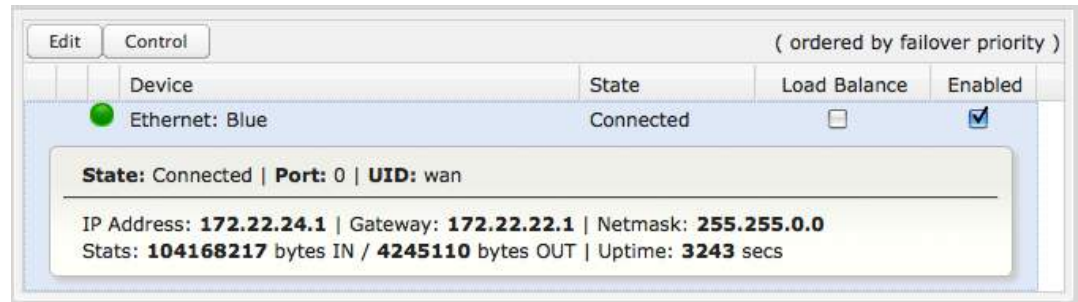

Click on a device in the list to reveal additional information about that device and to enable configuration options.

### 7.1.2 Device Configuration

Clicking on a device reveals the following information:

- **State** (Connected, Available, etc.)
- **Port**
- **UID** (Unique identifier. This could be a name or number/letter combination.)
- **IP Address**
- **Gateway**
- **Netmask**
- **Stats: bytes in, bytes out**
- **Uptime** (in seconds)

Click “Edit” to view configuration options for the selected device. For USB or ExpressCard modems, click “Control” to view options to activate or update the device.

Edit Control ( ordered by failover priority )			
Device	State	Load Balance	Enabled
 Ethernet: Blue	Connected	<input type="checkbox"/>	<input checked="" type="checkbox"/>

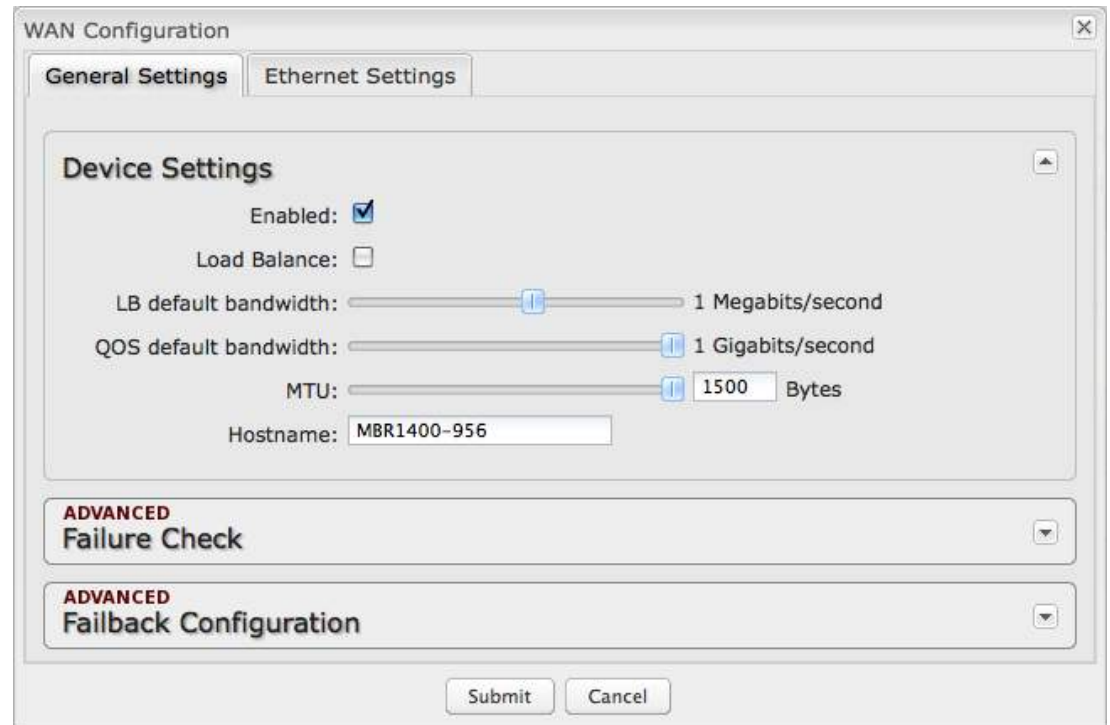

**State:** Connected | **Port:** 0 | **UID:** wan

---

IP Address: **172.22.24.1** | Gateway: **172.22.22.1** | Netmask: **255.255.0.0**  
Stats: **104168217** bytes IN / **4245110** bytes OUT | Uptime: **3243** secs

### 7.1.3 General Settings

- **Enabled:** Select/deselect to enable/disable.
- **Load Balance:** Select to allow this device to be available for the Load Balance pool.
- **LB default bandwidth:** Defines the default bandwidth for use in Load Balance algorithms. (Range: 100 Kilobits/second to 49 Megabits/second.)
- **QOS default bandwidth:** Defines the default bandwidth for use in QoS (quality of service, or traffic shaping) algorithms.
- **MTU:** Maximum transmission unit. This is the size of the largest protocol data unit that the device can pass. (Range: 46 to 1500 Bytes.)
- **Hostname** (This only shows for certain devices.)

WAN Configuration

General Settings | Ethernet Settings

**Device Settings**

Enabled:

Load Balance:

LB default bandwidth: 1 Megabits/second

QOS default bandwidth: 1 Gigabits/second

MTU: 1500 Bytes

Hostname: MBR1400-956

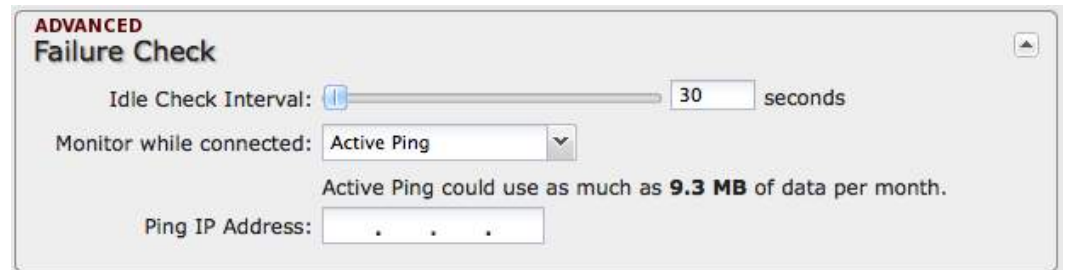

**ADVANCED**  
Failure Check

**ADVANCED**  
Failback Configuration

Submit Cancel

## **Failure Check (Advanced)**

If this is enabled, the router will check that the highest priority active WAN interface can get to the Internet even if the WAN connection is not actively being used. If the interface goes down, the router will switch to the next highest priority interface available. If this is not selected, the router will still failover to the next highest priority interface but only after the user has attempted to get out to the Internet and failed.

**Idle Check Interval:** The amount of time between each check. (Default: 30 seconds. Range: 10-3600 seconds.)

**Monitor while connected:** (Default: Off) Select from the following dropdown options:

- **Passive DNS (modem only):** The router will take no action until data is detected that is destined for the WAN. When this data is detected, the data will be sent and the router will check for received data for 2 seconds. If no data is received the router behaves as described below under **Active DNS**.
- **Active DNS (modem only):** A DNS request will be sent to the DNS servers. If no data is received, the DNS request will be retried 4 times at 5-second intervals. (The first 2 requests will be directed at the Primary DNS server and the second 2 requests will be directed at the Secondary DNS server.) If still no data is received, the device will be disconnected and failover will occur.
- **Active Ping:** A ping request will be sent to the Ping Target. If no data is received, the ping request will be retried 4 times at 5-second intervals. If still no data is received, the device will be disconnected and failover will occur. When “Active Ping” is selected, the next line gives an estimate of data usage in this form: “Active Ping could use as much as **9.3 MB** of data per month.” This amount depends on the Idle Check Interval.
- **Off:** Once the link is established the router takes no action to verify that it is still up.

**Ping IP Address:** If you selected “Active Ping”, you will need to input an IP address. This must be an address that can be reached through your WAN connection (modem/Ethernet). Some ISPs/Carriers block certain addresses, so choose an address that all of your WAN connections can use. For best results, select an established public IP address.

*For example, you might ping Google Public DNS at 8.8.8.8 or Level 3 Communications at 4.2.2.2.*

## **Failback Configuration (Advanced)**

This is used to configure failback, which is the ability to go back to a higher priority WAN interface if it regains connection to its network.

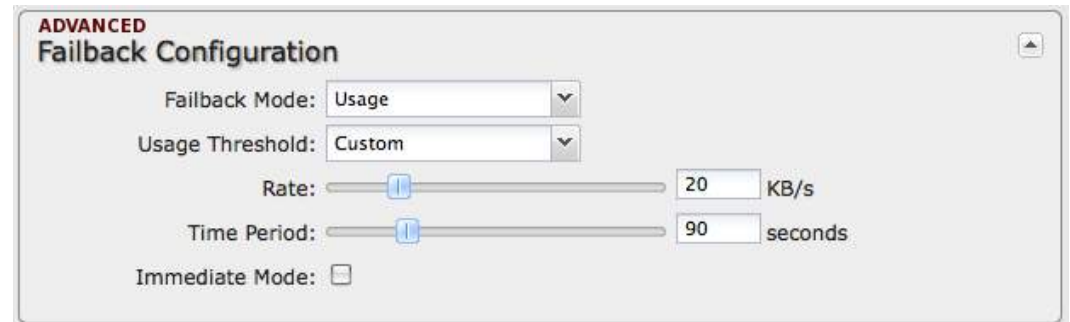

**Usage:** Fail back based on the amount of data passed over time. This is a good setting for when you have a dual-mode EVDO/WiMAX modem and you are going in and out of WiMAX coverage. If the router has failed over to EVDO it will wait until you have low data usage before bringing down the EVDO connection to check if a WiMAX connection can be made.

- **High** (Rate: 80 KB/s. Time Period: 30 seconds.)
- **Normal** (Rate: 20 KB/s. Time Period: 90 seconds.)
- **Low** (Rate: 10 KB/s. Time Period: 240 seconds.)
- **Custom** (Rate range: 1-100 KB/s. Time Period range: 10-300 seconds.)

**Time:** Fail back only after a set period of time. (Default: 90 seconds. Range: 10-300 seconds.) This is a good setting if you have a primary wired WAN connection and only use a modem for failover when your wired connection goes down. This ensures that the higher priority interface has remained online for a set period of time before it becomes active (in case the connection is dropping in and out, for example).

**Disabled:** Deactivate failback mode.

**Immediate Mode:** Fail back immediately whenever a higher priority interface is plugged in or when there is a priority change. Immediate failback returns you to the use of your preferred Internet source more quickly which may have advantages such as reducing the cost of a failover data plan, but it may cause more interruptions in your network than **Usage** or **Time** modes.

**ADVANCED**  
**Failback Configuration**

Failback Mode: Usage

Usage Threshold: Custom

Rate: 20 KB/s

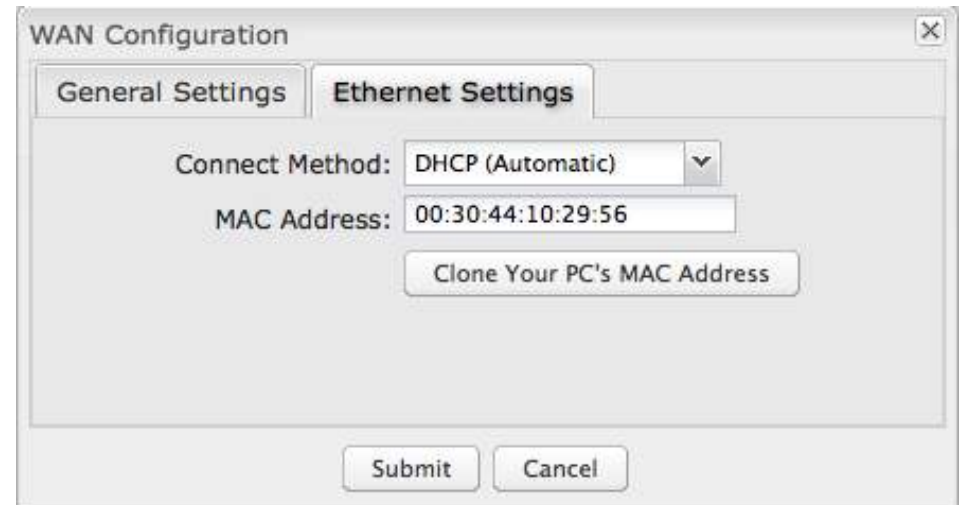

Time Period: 90 seconds

Immediate Mode:

### 7.1.4 Ethernet Settings

While default settings for each WAN Ethernet port will be sufficient in most circumstances, you have the ability to control:

- **Connect Method:** DHCP (Automatic), Static (Manual), or PPPoE (Point-to-Point Protocol over Ethernet).
- **MAC Address:** You have the ability to change the MAC address, but typically this is unnecessary. You can match this address with your device's address by clicking: "**Clone Your PC's MAC Address**".

The screenshot shows a 'WAN Configuration' dialog box with two tabs: 'General Settings' and 'Ethernet Settings'. The 'Ethernet Settings' tab is active. It contains a 'Connect Method' dropdown menu set to 'DHCP (Automatic)', a 'MAC Address' text field containing '00:30:44:10:29:56', and a button labeled 'Clone Your PC's MAC Address'. At the bottom of the dialog are 'Submit' and 'Cancel' buttons.

#### Connect Method

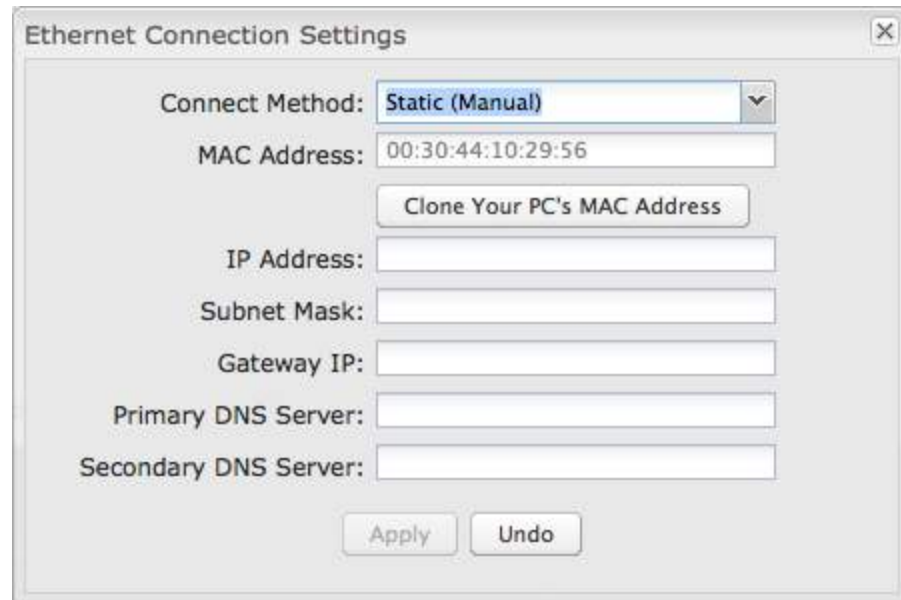

Select the connection type that you need for this WAN connection. You may need to check with your ISP or system administrator for this information.

- **DHCP** (Dynamic Host Configuration Protocol) is the most common configuration. Your router's Ethernet ports are automatically configured for DHCP connection. DHCP automatically assigns dynamic IP addresses to devices in your networks. This is preferable in most circumstances.
- **Static** allows you to input a specific IP address for your WAN connection; this should be provided by the ISP if supported.
- **PPPoE** should be configured with the username, password and other settings provided by your ISP.

If you want to use a Static (Manual) or PPPoE connection, you will need to fill out additional information.

**Static (Manual):**

- IP Address
- Subnet Mask
- Gateway IP
- Primary DNS Server
- Secondary DNS Server

**Ethernet Connection Settings**

Connect Method: **Static (Manual)**

MAC Address: 00:30:44:10:29:56

IP Address:

Subnet Mask:

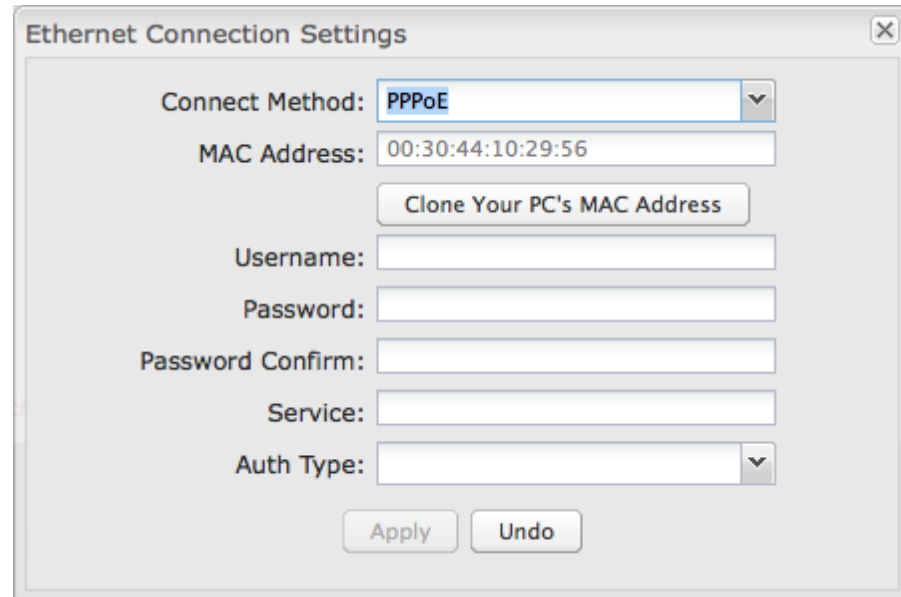

Gateway IP:

Primary DNS Server:

Secondary DNS Server:

**PPPoE:**

- Username
- Password
- Password Confirm
- Service
- Auth Type: None, PAP, CHAP

**Ethernet Connection Settings**

Connect Method: **PPPoE**

MAC Address: 00:30:44:10:29:56

Username:

Password:

Password Confirm:

Service:

Auth Type:

### 7.1.5 Modem Settings

**On Demand:** Typically modem connections are not always on. When this mode is selected a connection to the Internet is made as needed. When this mode is not selected a connection to the Internet is always maintained.

**Maximum Idle Time:** The interval for which the modem can be idle before it is disconnected.

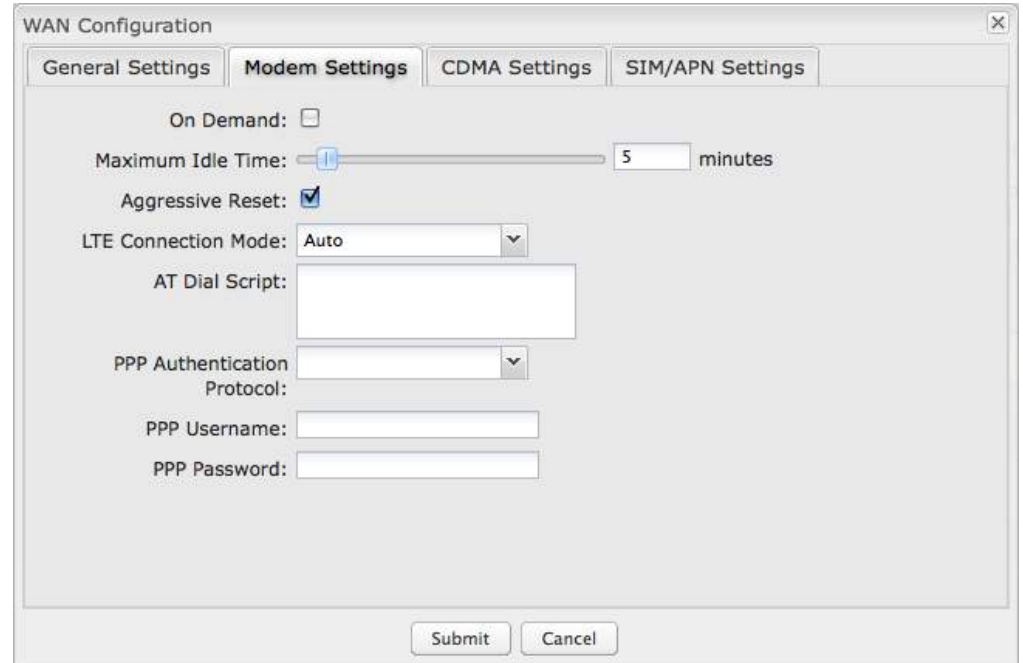

**Aggressive Reset:** When Aggressive Reset is enabled the system will attempt to maintain a good modem connection. If the Internet has been unreachable for a period of time a reset of the modem will occur in attempt to re-establish the connection.

**LTE Connection Mode:** Specify how the LTE Multi Mode modem should connect to the network.

- Auto: Let the modem decide which network to use.
- Auto EVDO/1xRTT: Connect to CDMA, letting the modem decide which 3G network to use. Do not attempt to connect to LTE.
- Force LTE: Connect to LTE only (do not attempt to connect to CDMA/GSM).
- Force EVDO: Connect to CDMA EVDO network only.
- Force 1xRTT: Connect to CDMA 1xRTT network only.

**AT Dial Script:** Enter the AT commands to be used in establishing a network connection. Each command must be entered on a separate line. All command responses must include “OK” except the final command response, which must include “CONNECT”.

Example:  
AT

The screenshot shows the 'WAN Configuration' dialog box with the 'Modem Settings' tab selected. The settings are as follows:

- On Demand:**
- Maximum Idle Time:** A slider set to 5 minutes.
- Aggressive Reset:**
- LTE Connection Mode:** Auto (dropdown menu)
- AT Dial Script:** An empty text area.
- PPP Authentication Protocol:** (dropdown menu)
- PPP Username:** (text input field)
- PPP Password:** (text input field)

Buttons for 'Submit' and 'Cancel' are located at the bottom right of the dialog.

```
AT+CGDCONT=2,"IP","isp.cingular"  
ATCT*99***2#
```

**PPP Authentication Protocol:** Set this only if your service provider requires a specific protocol and the **Auto** option chooses the wrong one.

- **Auto**
- **PAP** (Password Authentication Protocol)
- **CHAP** (Challenge Handshake Authentication Protocol)

**PPP Password:** Password for PPP authentication.

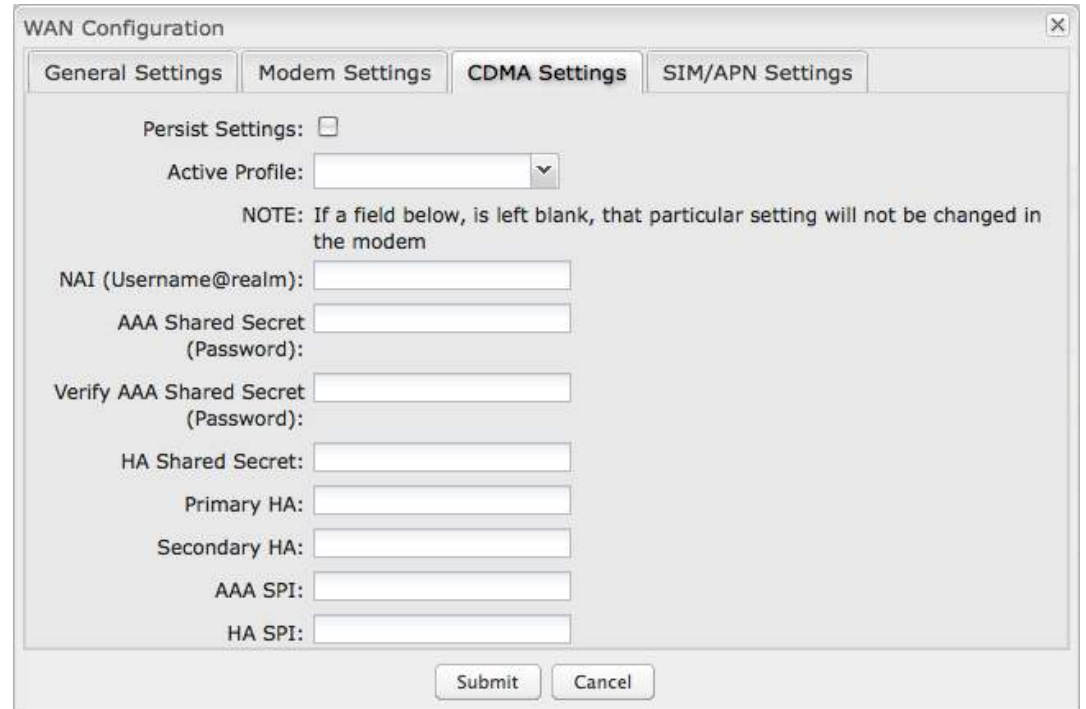

**PPP Username:** Username for PPP authentication.

## CDMA Settings

- **Persist Settings:**
- **Active Profile:** Select a number from 0-5 from the dropdown list.

The following fields can be left blank. If left blank they will remain unchanged in the modem.

- **NAI (Username@realm):** Network Access Identifier. NAI is a standard system of identifying users who attempt to connect to a network.
- **AAA Shared Secret (Password):** “Authentication, Authorization, and Accounting” password.
- **Verify AAA Shared Secret.**
- **HA Shared Secret:** “Home Agent” shared secret.
- **Primary HA.**
- **Secondary HA.**
- **AAA SPI:** AAA Security Parameter Index.
- **HA SPI:** HA Security Parameter Index.

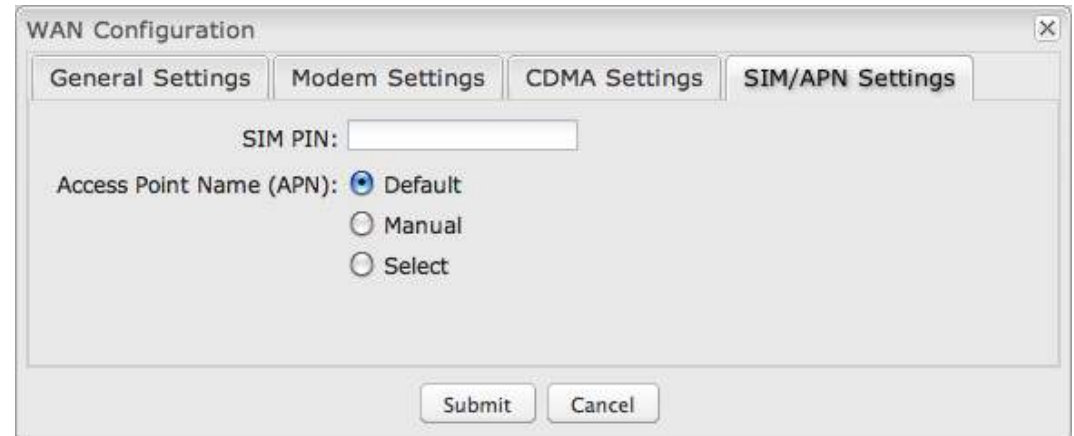

The screenshot shows the 'WAN Configuration' dialog box with the 'CDMA Settings' tab selected. The 'Persist Settings' checkbox is unchecked. The 'Active Profile' is a dropdown menu. Below these are several text input fields for NAI, AAA Shared Secret (Password), Verify AAA Shared Secret (Password), HA Shared Secret, Primary HA, Secondary HA, AAA SPI, and HA SPI. A note states: 'NOTE: If a field below, is left blank, that particular setting will not be changed in the modem'. At the bottom are 'Submit' and 'Cancel' buttons.

## SIM/APN Settings

**SIM PIN:** PIN number for a GSM modem with a locked SIM.

**Access Point Name (APN):** Some wireless carriers provide multiple Access Point Names that a modem can connect to. Some APN examples are “isp.cingular” and “vpn.com”.

- **Default:** Let the router choose an APN automatically.
- **Manual:** Enter an APN by hand.
- **Select:** Select from a dropdown menu of the profiles already on the SIM.

The screenshot shows a 'WAN Configuration' dialog box with four tabs: 'General Settings', 'Modem Settings', 'CDMA Settings', and 'SIM/APN Settings'. The 'SIM/APN Settings' tab is active. It contains a 'SIM PIN' text input field, an 'Access Point Name (APN)' section with three radio button options: 'Default' (selected), 'Manual', and 'Select'. At the bottom right, there are 'Submit' and 'Cancel' buttons.

## WiMAX Settings

**WiMAX Realm:** Select from the following dropdown options:

- Clear – clearwire-wmx.net
- Rover – rover-wmx.net
- Sprint 3G/4G – sprintpcs.com
- Xohm –xohm.com
- BridgeMAXX – bridgeMAXX.com
- Time Warner Cable – mobile.rr.com
- Comcast – mob.comcast.net

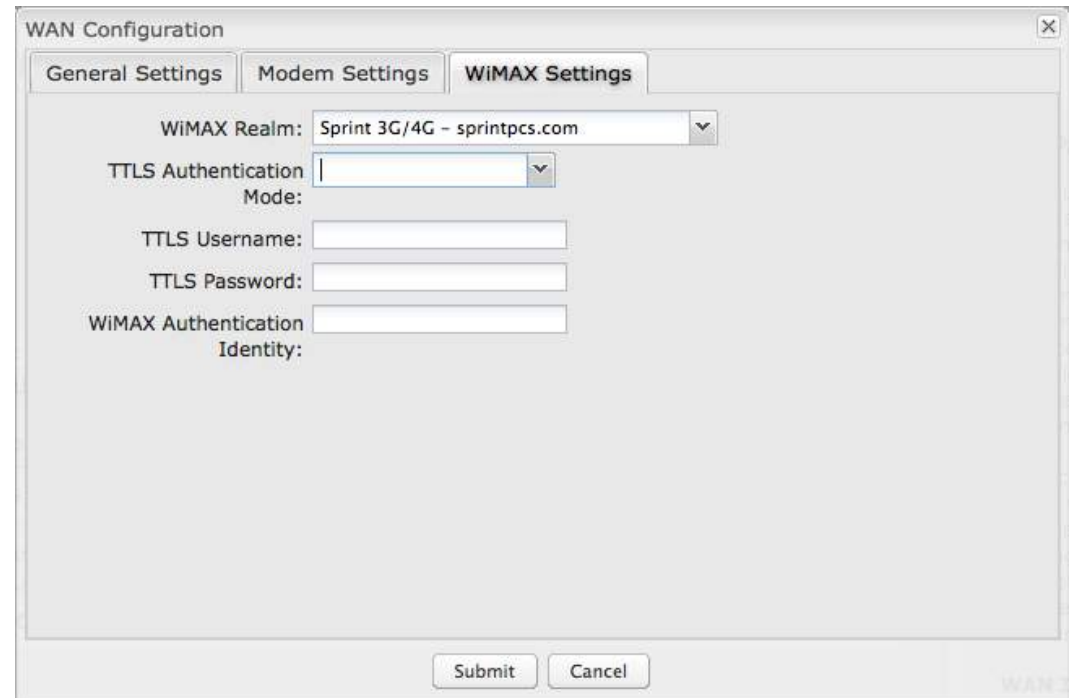

**TTLS Authentication Mode:** TTLS inner authentication protocol. Select from the following dropdown options:

- **MSCHAPv2/MD5** (Microsoft Challenge Handshake Authentication Protocol version2/Message-Digest Algorithm 5)
- **PAP** (Password Authentication Protocol)
- **CHAP** (Challenge Handshake Authentication Protocol)

**TTLS Username:** Username for TTLS authentication.

**TTLS Password:** Password for TTLS authentication.

**WiMAX Authentication Identity:** User ID on the network. Leave this blank unless your provider tells you otherwise.

### 7.1.6 Update/Activate a Modem

Some 3G modems can be updated and activated while plugged into the router. Updates and activation methods vary by modem model and service provider. Possible methods are: PRL Update, Activation, and FUMO. All supported methods will be displayed when you select your modem and click “Update/Activate”. If no methods are displayed for your device then you will need to update and activate your device externally.

To update or activate a modem, select the device and click “Control”.

**The modem *does not* support Update/Activate methods:** A message will state that there is no support for PRL Update, Activation, or FUMO.

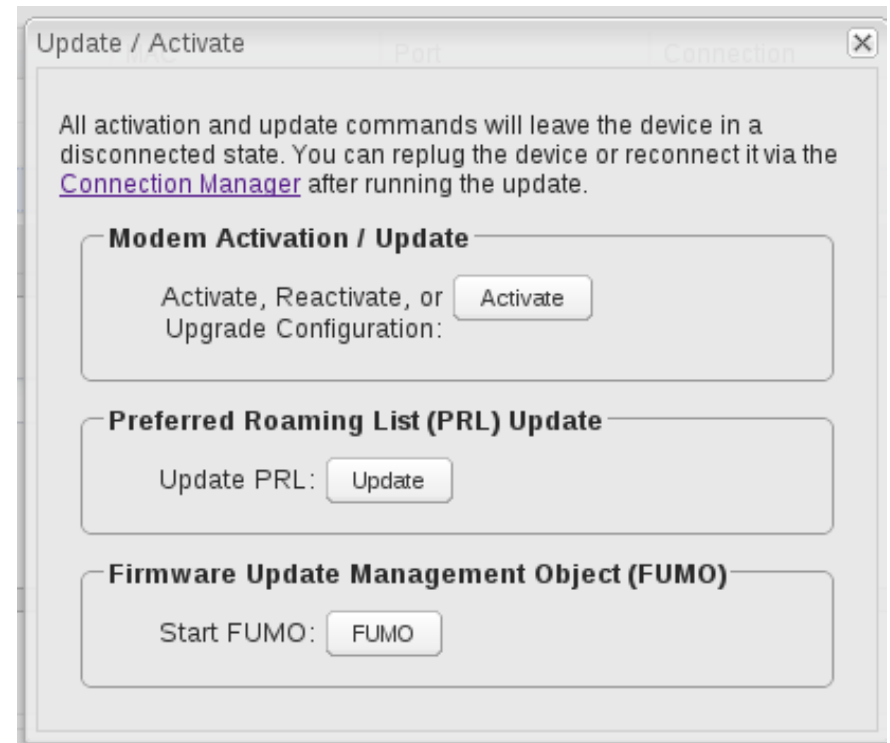

**The modem supports Update/Activate methods:** A message will display showing options for each supported method:

- **Modem Activation / Update:** Activate, Reactivate, or Upgrade Configuration.
- **Preferred Roaming List (PRL) Update**
- **Firmware Update Management Object (FUMO)**

Click the appropriate icon to start the process.

If the modem is connected when you start an operation the router will automatically disconnect it. The router may start another modem as a failover measure. When the operation is done the modem will go back to an idle state, at which point the router may restart it depending on failover and fallback settings.

NOTE: Only one operation is supported at a time. If you try to start the *same* operation on the *same* modem twice the UI will not report failure and the request will finish normally when the original request is done. However if you try to start a *different* operation or use a *different* modem, this second request will fail without interfering with the pending operation.

**Process Timeout:** If the process fails an error message will display.

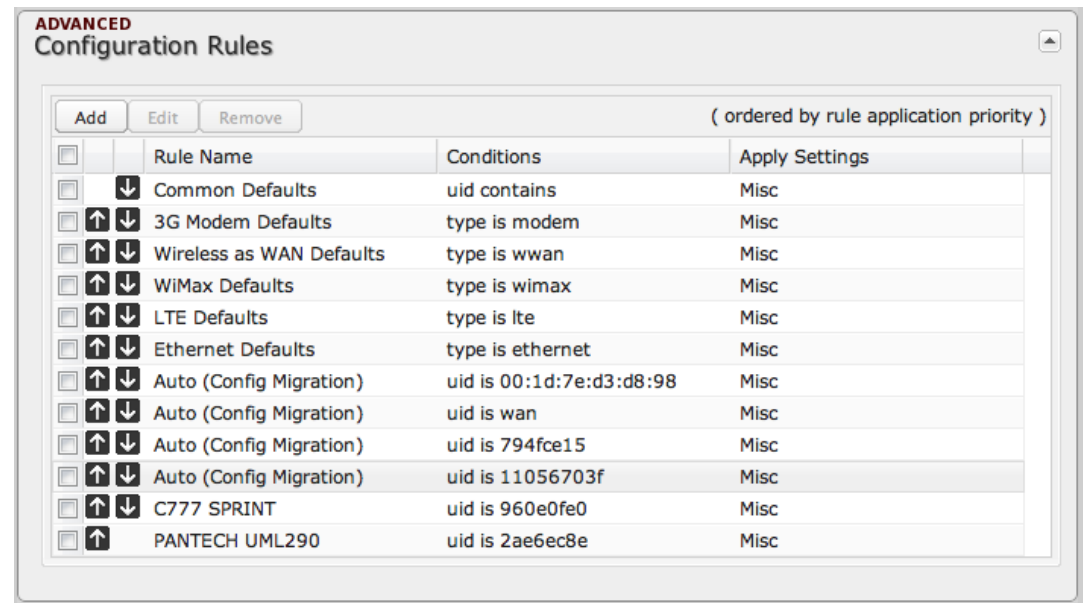

Activation has a 3-minute timeout, PRL update has a 4-minute timeout, and FUMO has a 10-minute timeout.

### 7.1.7 Configuration Rules (Advanced)

This section allows you to create general rules that apply to the Internet connections of a particular type. These can be general or very specific. For example, you could create a rule that applies to all WiMAX modems, or a rule that only applies to an Internet source with a particular MAC address.

The Configuration Rules list shows all rules that you have created, as well as all of the default rules. These are listed in the order they will be applied. The most general rules are listed at the top, and the most specific rules are at the bottom. The router goes down the list and applies all rules that fit for attached Internet sources. Configuration settings farther down the list will override previous settings.

Select any of these rules and click “Edit” to change the settings for a rule. To create a new rule, click “Add.”

## WAN Configuration Rule

This section allows you to create simple or complex rules that affect how individual Internet sources or classes of sources (perhaps all WiMAX modems or all modems from Sierra Wireless) behave in the router.

After clicking “Add” or “Edit,” you will see a popup with the following tabs:

- **Filter Criteria**
- **General Settings**
- **Ethernet Settings**
- **Modem Settings**
- **WiMAX Settings**
- **CDMA Settings**
- **SIM/APN Settings**

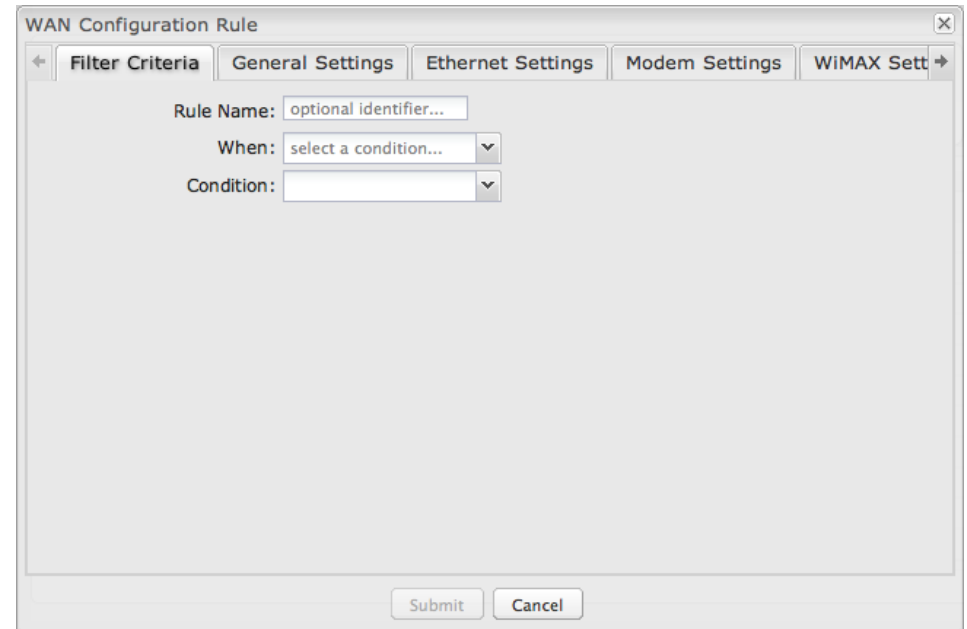

**Filter Criteria.** Begin by setting the **Filter Criteria** if you are creating a new rule. Create a name for your rule and the condition for which the rule applies:

**Rule Name:** Create a name meaningful to you. This name is optional.

Select each of the following to create a condition for your rule. **When:**

- **Port** (External USB Port; ExpressPort): Select by the port that you are plugging the modem into.
- **Manufacturer:** Select by the manufacturer, such as Sierra Wireless.
- **Model:** Set your rule according to the specific model of modem.
- **Type** (Ethernet, LTE, Modem, WiMAX, Wireless as WAN, HSPA): Select by type of Internet source.
- **Serial Number:** Select 3G or LTE modem by Serial Number.
- **MAC Address:** Select WiMAX modem by MAC Address.
- **Unique ID:** Select by ID. This is generated by the router and displayed when the device is connected to the router.

**Condition:** Select “is,” “is not,” “starts with,” “contains,” or “ends with” to create your condition’s statement.

The screenshot shows a window titled "WAN Configuration Rule" with a close button (X) in the top right corner. Below the title bar are five tabs: "Filter Criteria" (selected), "General Settings", "Ethernet Settings", "Modem Settings", and "WiMAX Settings". The "Filter Criteria" tab contains the following fields:

- Rule Name:** A text input field containing "optional identifier..."
- When:** A dropdown menu with "select a condition..." selected.
- Condition:** A dropdown menu.

At the bottom of the dialog are two buttons: "Submit" and "Cancel".

**Value:** If you chose Port or Type, select from the dropdown list. If you chose Manufacturer, Model, Serial Number, MAC Address, or Unique ID, you will need to manually input the information.

The condition will be of the following form:

“     (When)     is/is not     (value)     ”

For example:

“Type is not WiMAX”

“Port is External USB Port”

Once you have established the condition for your configuration rule, choose from the other tabs to set the desired configuration. Use the arrow buttons along the top to reveal more tab options. All of the tab options: **General Settings**, **Ethernet Settings**, **Modem Settings**, **WiMAX Settings**, **CDMA Settings**, and **SIM/APN Settings** have the same configuration options shown above in the WAN Configuration section (the options for Configuration Rules are the same as they are for individual devices).

## 7.2 Data Usage

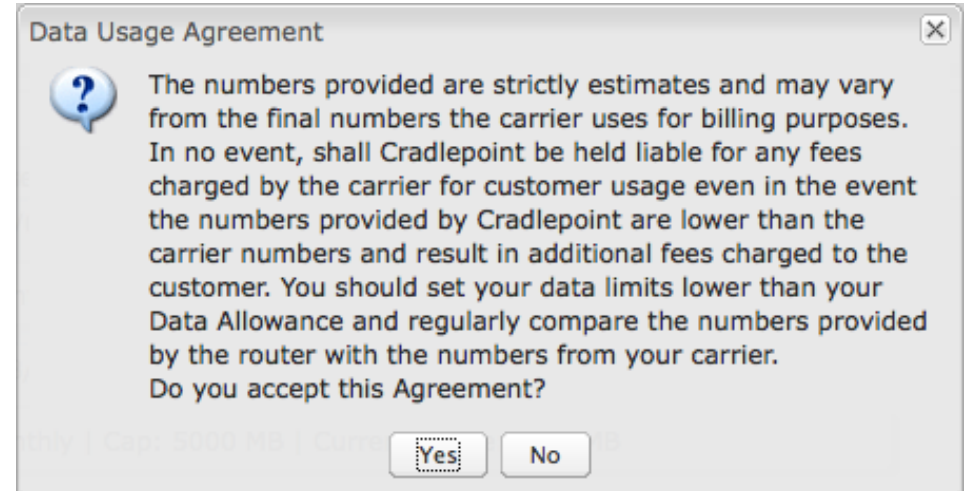

**Data Usage Management & Alerts** allows you to create and manage rules that help control the data usage of a modem. If you have a limited data plan or a price increase on your plan after a certain amount of usage, a **Data Usage Rule** can help you track these amounts. You can set a rule to shut down use of a modem and/or send a message when you reach a data usage amount you set.

Enable Data Usage:  Enabled  Disabled

**Enable Data Usage:** Enabled/Disabled. (Default: Disabled.)

When you select **Enabled**, you will see the **Data Usage Agreement** shown to the right. The purpose of this agreement is to ensure that you understand that the data numbers for the CBR400 may not perfectly match those of your carrier: CradlePoint cannot be held responsible. You must accept the agreement by clicking **Yes** in order to begin creating data usage rules.

**Warning:** You should set your data limits lower than your Data Allowance and regularly compare the numbers provided by the router with the numbers from your carrier.

## 7.2.1 Data Usage Rules

The Data Usage Rule display shows basic information for each rule you have created (including rules created with a template). The following information is displayed:

- **Rule Name**
- **Enabled:** True/False
- **Date for Rule Reset**
- **Cycle Type:** Daily, Weekly, or Monthly
- **Cap:** Amount in MB.
- **Current Usage:** Shown as an amount in MB, as a percentage of the cap, and in a bar graph.

Rule Name	Rule resets on	Current Usage percent
ee	(Fri) 08/05/2011	4%
Enabled: True   Cycle Type: Monthly   Cap: 5000 MB   Current Usage: 219.08 MB		
4g	(Sat) 08/06/2011	40%
Enabled: True   Cycle Type: Monthly   Cap: 5000 MB   Current Usage: 2022.75 MB		
ere	(Sun) 08/07/2011	3%
Enabled: True   Cycle Type: Monthly   Cap: 5000 MB   Current Usage: 174.86 MB		

Click **Add** to configure a new Data Usage Rule.

### Usage Rule Configuration – page 1

**Rule Name:** Give your rule a name for later recognition.

**WAN Selection:** Select from the dropdown list of currently attached WAN devices.

**Assigned Usage in MB:** Enter a cap amount in megabytes. 1024 megabytes equals 1 gigabyte.

**Rule Enabled:** (Default: Enabled.) Click to disable.

Click **Next** to continue to page 2.

**Data Usage Rule** ✕

**Usage Rule Configuration**

Rule Name:

Wan Selection:  ▾

Assigned Usage in MB:

Rule Enabled:

## Usage Rule Configuration – page 2

**Cycle Type:** How often the rule will reset. The data usage amount will be reset at the end of each cycle. Select the length of a cycle from a dropdown menu with the following choices:

- Daily
- Weekly
- Monthly

**Cycle Start Date:** Select the date you wish the rule to begin. This date will be used to track when the rule will be reset.

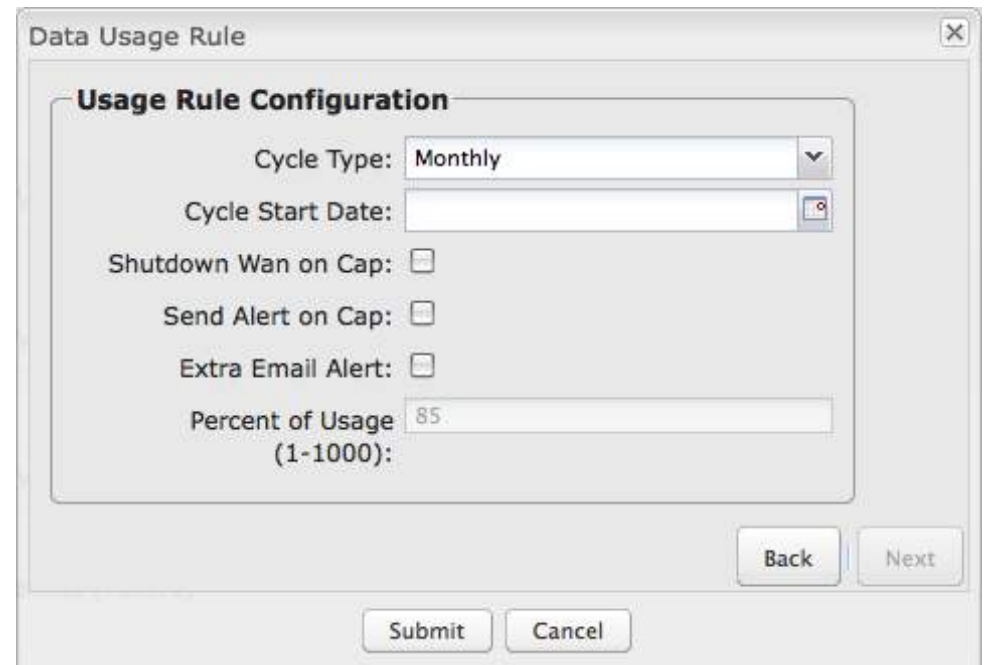

**Shutdown WAN on Cap:** If selected, the WAN device will shut down when the assigned usage is reached. A cycle reset or a rule deletion will re-enable the device.

**Send Alert on Cap:** An email alert will be generated and sent when the assigned usage is reached.

**WARNING: The SMTP mail server must be configured in System Settings → Device Alerts.**

**Custom Alert:** When checked you enable a second email to be configured for a percentage of the assigned usage.

**Percent of Usage (1-1000):** If selected, a custom alert will be sent when your data usage reaches this percentage of your usage cap. For example, you could set this at 90 percent so that you know when your usage is nearing 100 percent of the cap.

## 7.2.2 Template Configuration

**Templates** allow you to control multiple WAN devices with the same rule. Each WAN device that matches a template will automatically have its own rule created.

For example, you can set a template rule for all mobile data modems that causes your router to send an alert after 1000 MB of usage in a month. When you attach a new 4G USB modem, your template will immediately create a new **Data Usage Rule** for the attached modem that sends the alert as specified.

Click **Add** to configure a new Template rule.

Create a **Template Name** that you can recognize.

The template will apply to one of the following

**WAN types:**

- All WAN
- All Ethernet
- All Modems

Select one of these types.

The rest of the rule settings options match those in the **Data Usage Rules**. See the section above for additional information about how to configure your template usage rules.

Template configuration			
<input type="checkbox"/> Template Name	WAN type	Assigned Usage in MB	Cycle Type
<input type="checkbox"/> USB data plans	modem	5000	monthly

**Template Rule Creation** ✕

Template Name:

Assigned Usage in MB:

Cycle Type:  ▾

Cycle Start Date:

Shutdown WAN on Cap:

Send Alert on Cap:

Extra Email Alert:

Percent of Usage (1-1000):

### 7.2.3 Historical Data

Historical Data shows a graph of data usage for each attached WAN source that has an assigned Data Usage Rule. The graph shows the usage trend for one day.

Click **Add Usage** to manually input additional usage for an attached data source. You might do this if you used your modem while not attached to your router and you want to keep an accurate count of your data usage.

Enter the date of usage by using the pop-up calendar. Then enter the total data in MB—both in and out—to update the usage amounts.

**Add data usage** ✕

Select Date:

Total MB In:

Total MB Out:

### 7.3 GRE Tunnels

Generic Routing Encapsulation (GRE) tunnels can be used to create a connection between two private networks. The CBR400 is enabled for either GRE or VPN tunnels. GRE tunnels are simpler to configure and more flexible for different kinds of packet exchanges, but VPN tunnels are much more secure.

GRE Tunnels							
<input type="button" value="Add"/> <input type="button" value="Edit"/> <input type="button" value="Remove"/>							
<input type="checkbox"/>	Name	Local Network	Remote Network	Remote Gateway	Routes	Keep Alive	Enabled
<input type="checkbox"/>	office_tunnel	10.1.1.1 255.255.255.0	10.1.1.2 255.255.255.0	172.22.22.1	1	Yes	Yes

In order to set up a tunnel you must know the following:

- **Local Network** and **Remote Network** addresses for the “**Glue Network**,” the network that is created by the administrator that serves as the “glue” between the networks of the tunnel. Each address must be a different IP address from the same private network, and these addresses together form the endpoints of the tunnel.
- **Remote Gateway**, the public facing WAN IP address that the local gateway is going to connect to.
- Optionally, you might also want to enable the tunnel **Keep Alive** feature to monitor the status of a tunnel and more accurately determine if the tunnel is alive or not.

Click **Add** to configure a new GRE tunnel.

## Page 1: General

**Tunnel Name:** Choose a name that is meaningful to you.

**Local Network:** This is the local side of the “**Glue Network**,” a network created by the administrator to form the tunnel. The user creates the IP address inputted here. It must be different from the IP addresses of the networks it is gluing together.

Choose any private IP address from the following three ranges that doesn't match either network:

- 10.0.0.0 - 10.255.255.255
- 172.16.0.0 - 172.31.255.255
- 192.168.0.0 - 192.168.255.255

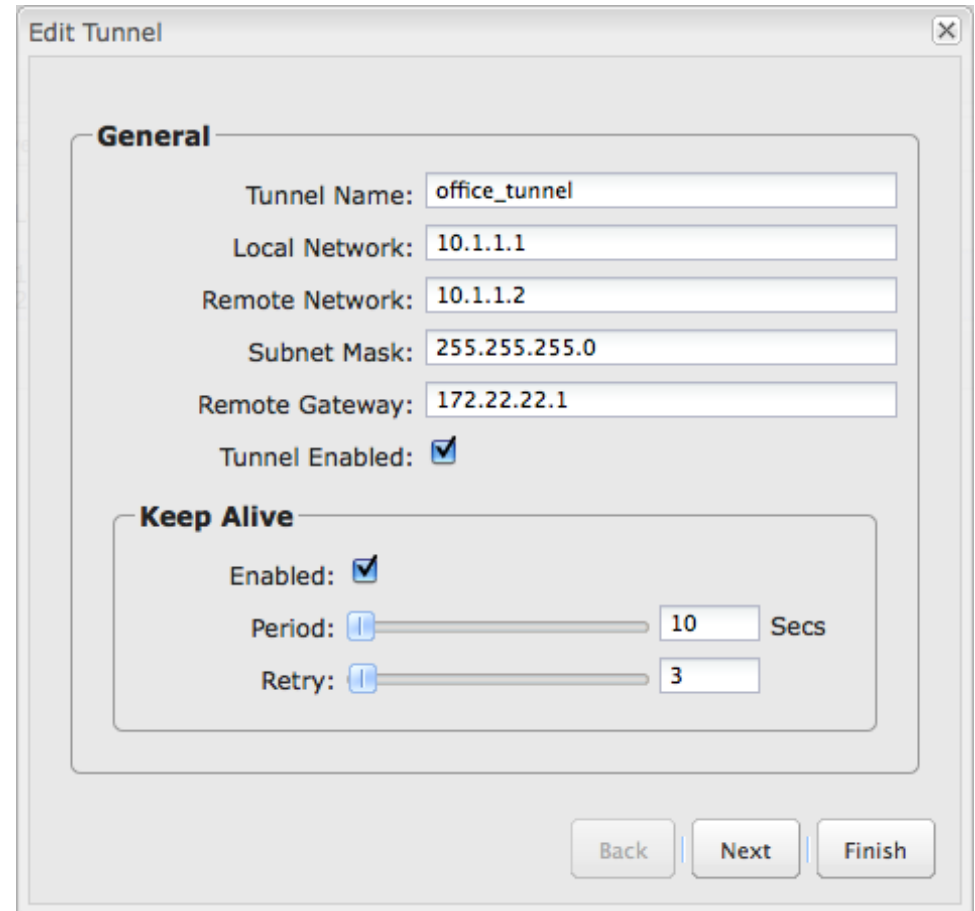

**Remote Network:** This is the remote side of the “**Glue Network**.” Again, the user must create an IP address that is distinct from the IP addresses of the networks that are being glued together.

The Remote Network and Local Network values will be flipped when inputted for the other side of the tunnel configuration.

**Subnet Mask:** This is the subnet mask for the Glue Network. The Local and Remote Network addresses must fit with this mask. 255.255.255.0 is a logical choice for most users.

**Remote Gateway:** This is the public facing, WAN-side IP address of the network that the local gateway is going to connect to.

**Tunnel Enabled:** Select to activate the tunnel.

**Keep Alive:** This feature monitors the status of a tunnel. This will more accurately determine if the tunnel is alive or not. Choose the length of time in seconds of the **Period** for each check (Default: 10 seconds. Range: 2 – 3600 seconds) and the number of **Retry** attempts (Default: 3. Range: 1 – 255).

## Page 2: Routes

Adding routes allows you to configure what types of network traffic from the local host or hosts will be allowed through the tunnel.

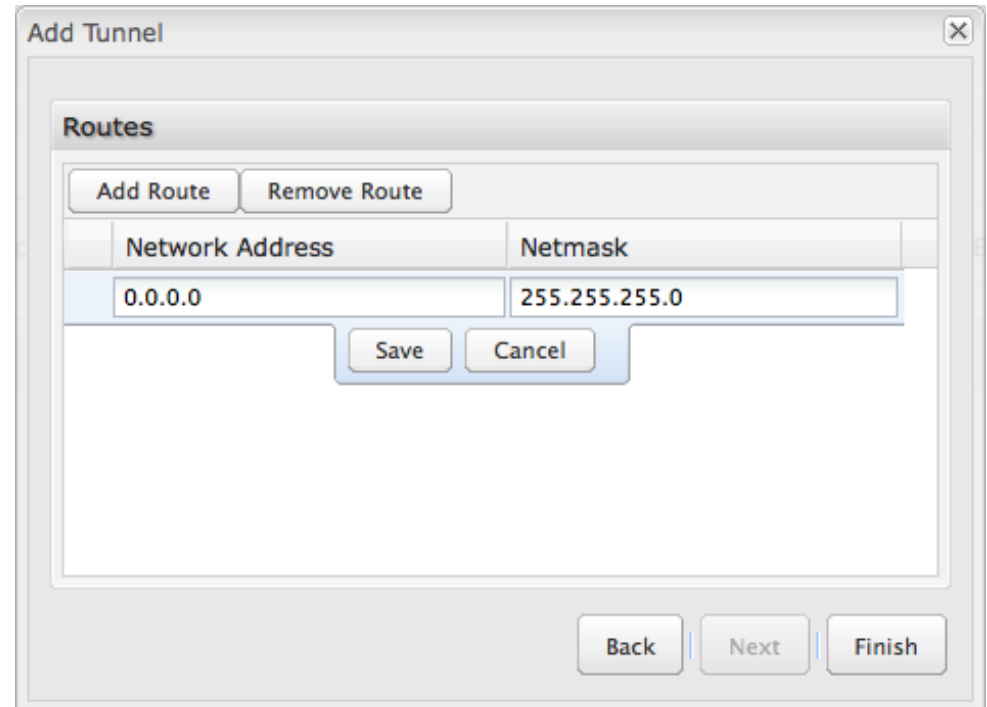

Click **Add Route** to configure a new route. You will need to input the following information, defined by the remote network:

- **Network Address**
- **Netmask:** (Default: 255.255.255.0)

You can set the tunnel to connect to a range of IP addresses or to a single IP address. For example, you could input **192.168.0.0** and **255.255.255.0** to connect your tunnel to all the addresses of the remote network in the **192.168.0.x** range. Alternatively, you could select a single address by inputting that address along with a Netmask of **255.255.255.255**.

Click **Save** to record each new route.

When you have finished adding routes, click **Finish** to save your GRE tunnel configuration.

The screenshot shows a dialog box titled "Add Tunnel" with a close button (X) in the top right corner. Inside the dialog, there is a section titled "Routes". At the top of this section are two buttons: "Add Route" and "Remove Route". Below these buttons is a table with two columns: "Network Address" and "Netmask". The "Network Address" column contains the text "0.0.0.0" and the "Netmask" column contains "255.255.255.0". Below the table are two buttons: "Save" and "Cancel". At the bottom of the dialog box, there are three buttons: "Back", "Next", and "Finish".

### 7.3.1 Global GRE Settings

GRE will use the primary WAN for connection, which will allow it to failover to other WANs as needed. If GRE needs to be tied to a particular WAN, it can be done by deselecting the box and selecting the appropriate WAN.

**Global GRE Settings**

Use Primary WAN:

WAN Binding Type: When Type is Ethernet

Apply Undo

**Use Primary WAN:** (Default: Selected.) Deselect to open further options.

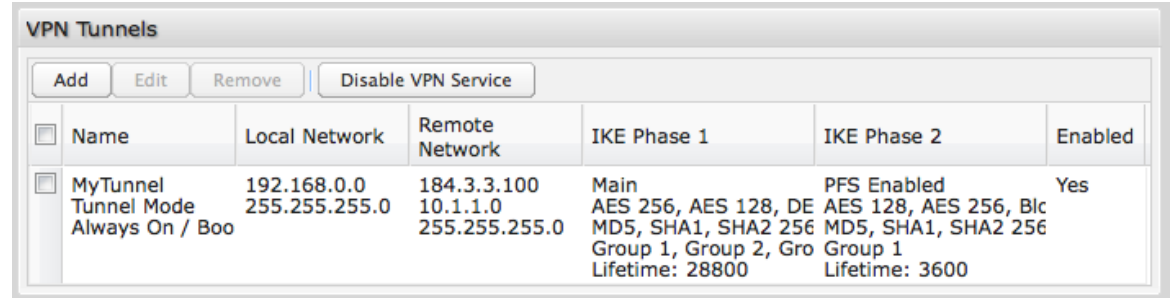

**WAN Binding Type:** You have several options for specifying the type of WAN interface(s) you want associated with GRE Tunnels. Designate the interface(s) by **Port**, **Manufacturer**, **Model**, **Type**, **Serial Number**, **MAC Address**, or **Unique ID**. This selection will create a dropdown list of options to complete a sentence with the following form: “When \_\_\_\_\_ is \_\_\_\_\_,” such as, “When TYPE is LTE.” You also have the option to replace “is” with “isn’t,” “starts with,” “ends with,” or “contains.”

- **Port:** Select from the dropdown list of possible WAN ports on the router.
  - LAN Ethernet
  - USB
  - ExpressPort
- **Manufacturer:** Select from a dropdown list of attached devices.
- **Model:** Select from a dropdown list of attached devices.
- **Type:** Select from the dropdown list of possible WAN types.
  - WiMAX
  - Modem
  - LTE
  - Ethernet

- Wireless As WAN
  - **Serial Number:** Select from a dropdown list of attached devices.
  - **MAC Address:** Select from a dropdown list of attached devices.
  - **Unique ID:** Select from a dropdown list of attached devices.

## 7.4 VPN Tunnels

VPN (virtual private network) tunnels are used to establish a secure connection to a remote network over a public network. For example, VPN tunnels can be used across the Internet by an individual to connect to an office network while traveling or by two office networks to function as one network. The two networks set up a secure connection across the (normally) unsecure Internet by assigning VPN encryption protocols.

<input type="checkbox"/>	Name	Local Network	Remote Network	IKE Phase 1	IKE Phase 2	Enabled
<input type="checkbox"/>	MyTunnel	192.168.0.0	184.3.3.100	Main	PFS Enabled	Yes
	Tunnel Mode	255.255.255.0	10.1.1.0	AES 256, AES 128, DE	AES 128, AES 256, Blc	
	Always On / Boo		255.255.255.0	MD5, SHA1, SHA2 256	MD5, SHA1, SHA2 256	
				Group 1, Group 2, Gro	Group 1	
				Lifetime: 28800	Lifetime: 3600	

The CBR400 uses IPsec (Internet Protocol security) to authenticate and encrypt packets exchanged across the tunnel. To set up a VPN tunnel with the CBR400 on one end, there must be another device (usually a router) that also supports IPsec on the other end.

IKE (Internet Key Exchange) is the security protocol in IPsec. IKE has two phases, Phase 1 and Phase 2. The CBR400 has several different security protocol options for each phase, but the default selections will be sufficient for most users.

The VPN tunnel status page allows you to view the state of the VPN tunnels. If a tunnel fails to connect to the remote site, check the System Logs for more information. You may double click on a cell to directly edit that information.

Click **Add** to configure a new VPN tunnel.

### 7.4.1 Page 1: General

**Tunnel Name:** Choose a name meaningful to you.

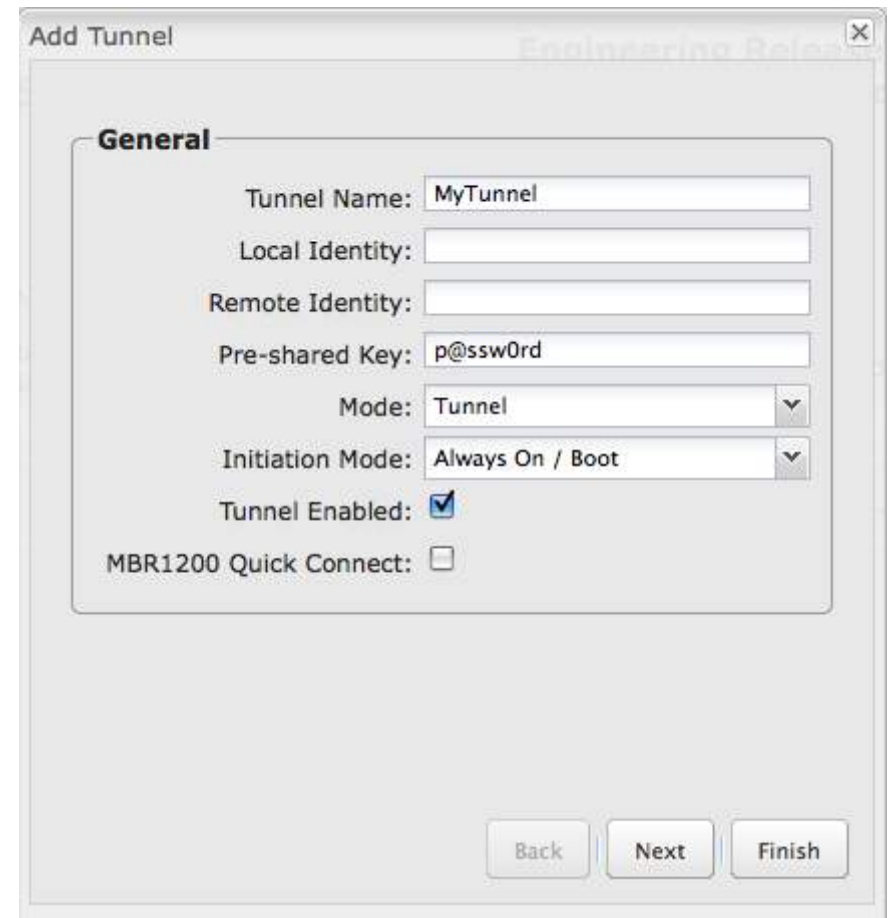

**Local Identity:** This can be left blank for most users. If left blank it will default to the IP address of the WAN connection. Currently we only support identifiers in the form of an **IP address**, a **user fully qualified domain name** (user@mydomain.com) or just a **fully qualified domain name** (www.mydomain.com). If the remote side of the tunnel is configured to expect an identifier, then both **must match** in order for the negotiation to succeed.

**Remote Identity:** This can be left blank for most users. If left blank it will default to the IP address of the WAN connection. Currently we only support identifiers in the form of an **IP address**, a **user fully qualified domain name** (user@mydomain.com) or just a **fully qualified domain name** (www.mydomain.com). If no identifier is defined then no verification of the remote peer's identification will be done.

**Pre-shared Key:** Create a password or key. The routers on both sides of the tunnel must use this same key.

**Mode:** **Tunnel** or **Transport**. **Tunnel Mode** is used for protecting traffic between different networks, when traffic must pass through an intermediate, untrusted network. **Transport Mode** is used for end-to-end communications (for example, for communications between a client and a server).

**Initiator Mode:** “**Always On/Boot**” or “**On Demand.**” “**Always On/Boot**” is used if you want the tunnel to initiate the tunnel connection whenever the WAN becomes available. **On Demand** is used if you want the tunnel to initiate a connection if and only if there is data traffic bound for the remote side of the tunnel.

**Tunnel Enabled:** Enabled or Disabled.

**MBR1200 Quick Connect:** VPN tunnels in the CBR400 have more choices than they do in the MBR1200, so it is more complex to configure. Check this box to simplify setup by streamlining your options.

## 7.4.2 Page 2: Networks

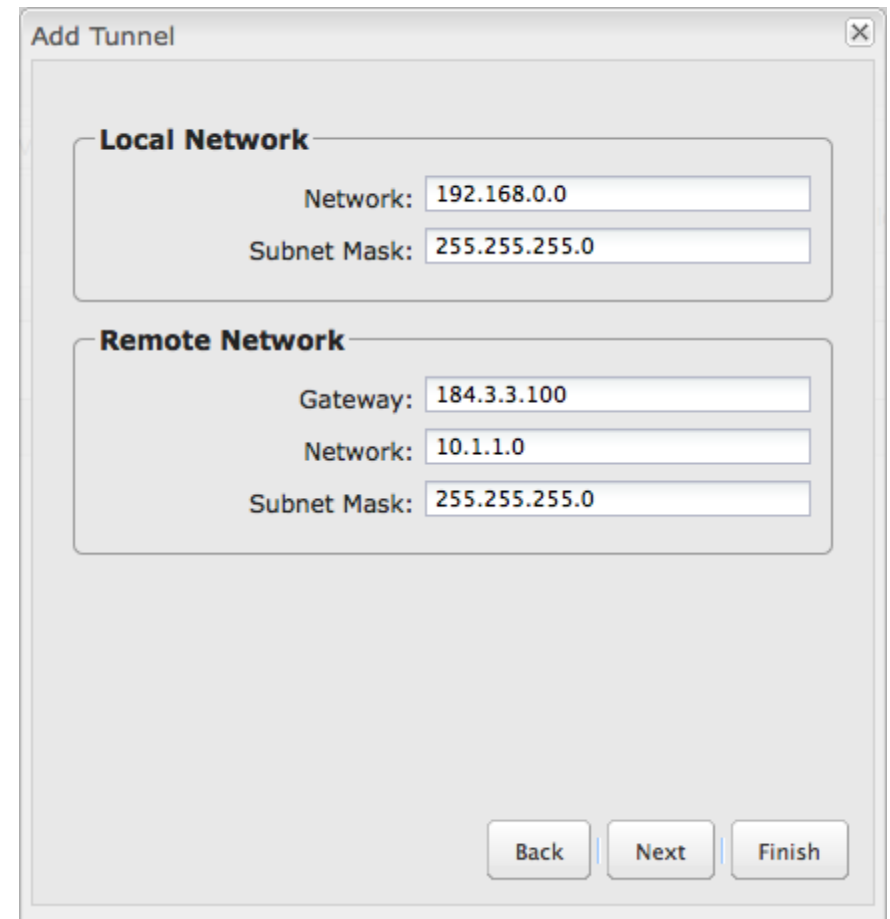

**Local Network:** The **Network** IP address and the **Subnet Mask** define what local devices have access to or can be accessed from the VPN tunnel. The CBR400 will automatically fill in the values for your network, but you can change the values to limit the tunnel to only some of the devices in your network.

NOTE: The local network IP address *must* be different from the remote network IP address.

**Remote Network:** Enter the remote **Gateway's** IP address or fully qualified domain name (my.domain.com). It is recommended you use a dynamic DNS host name instead of the static IP address. By using the dynamic DNS host name updates of the remote WAN IP are compensated for while connecting to a VPN tunnel.

Enter the **Network** IP address with the **Subnet Mask** to define the remote network subnet that the local devices will have access to.

NOTE: The remote network IP address *must* be different from the local network IP address.

The screenshot shows a web-based configuration window titled "Add Tunnel". It contains two main sections: "Local Network" and "Remote Network".

**Local Network:**

- Network: 192.168.0.0
- Subnet Mask: 255.255.255.0

**Remote Network:**

- Gateway: 184.3.3.100
- Network: 10.1.1.0
- Subnet Mask: 255.255.255.0

At the bottom of the window, there are three buttons: "Back", "Next", and "Finish".

### 7.4.3 Page 3: IKE Phase 1

IKE security has two phases, Phase 1 and Phase 2. You have the ability to distinctly configure each phase, but the default settings will be sufficient for most users.

To set up a tunnel with a remote site, you need to match your tunnel's IKE negotiation parameters with the remote site. By selecting several encryption, hash, and DH group options, you improve your chances for a successful tunnel negotiation. For greatest compatibility, select all options; for greatest security, select only the most secure options that your devices support.

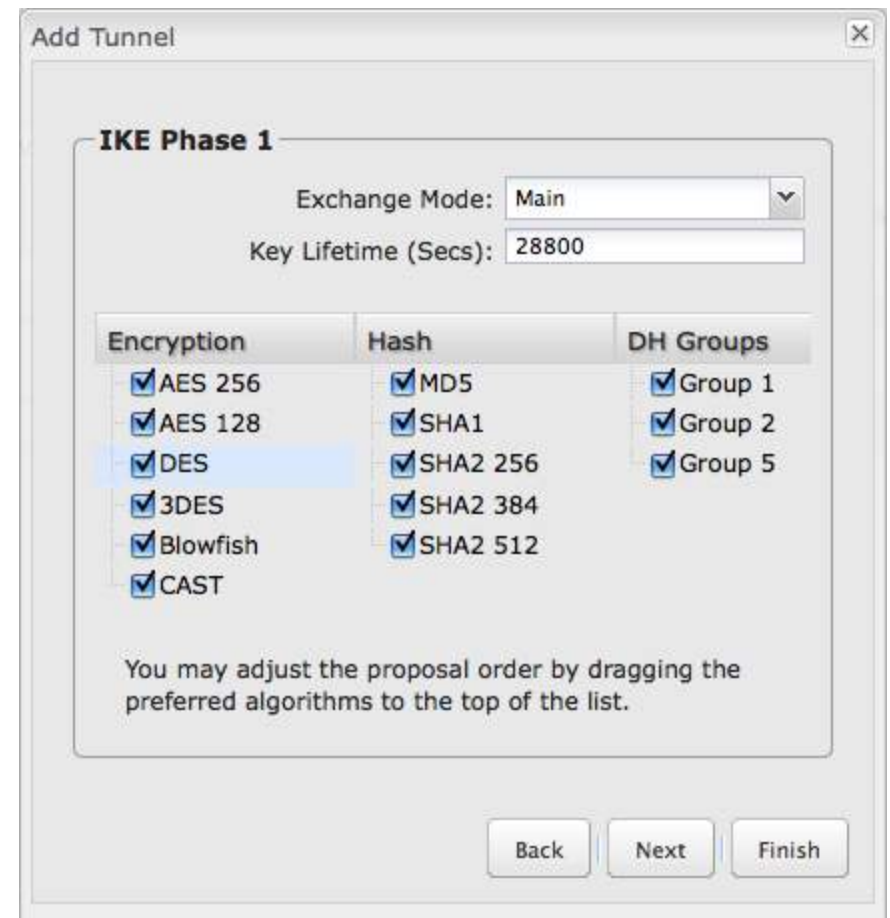

**Exchange Mode:** The IKE protocol has 2 modes of negotiating phase 1 - **Main** (also called Identity Protection) and **Aggressive**.

- In **Main** mode, IKE separates the key information from the identities, allowing for the identities of peers to be secure at the expense of extra packet exchanges.
- In **Aggressive** mode, IKE tries to combine as much information into fewer packets while maintaining security. Aggressive mode is slightly faster but less secure.

Because it has better security, **Main** mode is recommended for most users.

**Key Lifetime:** The lifetime of the generated keys of Phase 1 of the IPsec negotiation from IKE. After the time has expired, IKE will renegotiate a new set of Phase 1 keys.

**Encryption, Hash, and DH Groups:** Each IKE exchange uses one encryption algorithm, one hash function, and one DH group to make a secure exchange.

The screenshot shows the 'Add Tunnel' configuration window. Under the 'IKE Phase 1' section, the 'Exchange Mode' is set to 'Main' and the 'Key Lifetime (Secs)' is set to 28800. Below these are three columns of options: Encryption, Hash, and DH Groups. All options in these columns are checked.

Encryption	Hash	DH Groups
<input checked="" type="checkbox"/> AES 256	<input checked="" type="checkbox"/> MD5	<input checked="" type="checkbox"/> Group 1
<input checked="" type="checkbox"/> AES 128	<input checked="" type="checkbox"/> SHA1	<input checked="" type="checkbox"/> Group 2
<input checked="" type="checkbox"/> DES	<input checked="" type="checkbox"/> SHA2 256	<input checked="" type="checkbox"/> Group 5
<input checked="" type="checkbox"/> 3DES	<input checked="" type="checkbox"/> SHA2 384	
<input checked="" type="checkbox"/> Blowfish	<input checked="" type="checkbox"/> SHA2 512	
<input checked="" type="checkbox"/> CAST		

At the bottom of the window, there are three buttons: 'Back', 'Next', and 'Finish'. A note at the bottom of the configuration area states: 'You may adjust the proposal order by dragging the preferred algorithms to the top of the list.'

- **Encryption:** Used to encrypt messages sent and received by IPsec.
  - AES 128
  - AES 256
  - Blowfish
  - CAST
  - DES
  - 3DES
- **Hash:** Used to compare, authenticate, and validate that data across the VPN arrives in its intended form and to derive keys used by IPsec.
  - MD5
  - SHA1
  - SHA2 256
  - SHA2 384
  - SHA2 512
- **DH Groups:** The DH (Diffie-Hellman) Group is a property of IKE and is used to determine the length of prime numbers associated with key generation. The strength of the key generated is partially determined by the strength of the DH Group. Group 5, for instance, has greater strength than Group 2.
  - DH group 1: 768-bit key.
  - DH group 2: 1024-bit key.
  - DH group 5: 1536-bit key.

In Phase 1, only one DH group can be selected while using **Aggressive** exchange mode.

By default, all the algorithms (encryption, hash, and DH groups) supported by the CBR400 are checked, which means they are *allowed* for any given exchange. Deselect these options to limit which algorithms will be accepted. Be sure to check that the router (or similar device) at the other end of the tunnel has matching algorithms.

The algorithms are listed in order by priority. You can reorder this priority list by clicking and dragging algorithms up or down. Any selected algorithm may be used for IKE exchange, but the algorithms on the top of the list are more likely to be used more often.

#### 7.4.4 Page 4: IKE Phase 2

**Perfect Forward Secrecy (PFS):** Enabling this feature will require IKE to generate a new set of keys in Phase 2 rather than using the same key generated in Phase 1.

Additionally, the new keys generated in Phase 2 (with this option enabled) are exchanged in an encrypted session. Enabling this feature affords the policy greater security.

**Key Lifetime:** The lifetime of the generated keys of Phase 2 of the IPsec negotiation from IKE. After the time has expired, IKE will renegotiate a new set of Phase 2 keys.

Phase 2 has the same selection of **Encryption**, **Hash**, and **DH Groups** as Phase 1, but you are restricted to only one DH Group. Phase 2 and Phase 1 selections do not have to match.

**Add Tunnel**

**IKE Phase 2**

Perfect Forward Secrecy:

Key Lifetime (Secs):

Encryption	Hash	DH Groups
<input checked="" type="checkbox"/> AES 128	<input checked="" type="checkbox"/> MD5	<input checked="" type="checkbox"/> Group 1
<input checked="" type="checkbox"/> AES 256	<input checked="" type="checkbox"/> SHA1	<input type="checkbox"/> Group 2
<input checked="" type="checkbox"/> Blowfish	<input checked="" type="checkbox"/> SHA2 256	<input type="checkbox"/> Group 5
<input checked="" type="checkbox"/> CAST	<input checked="" type="checkbox"/> SHA2 384	
<input checked="" type="checkbox"/> DES	<input checked="" type="checkbox"/> SHA2 512	
<input checked="" type="checkbox"/> 3DES		

You may adjust the proposal order by dragging the preferred algorithms to the top of the list.

Back Next Finish

#### 7.4.5 Page 5: Dead Peer Detection

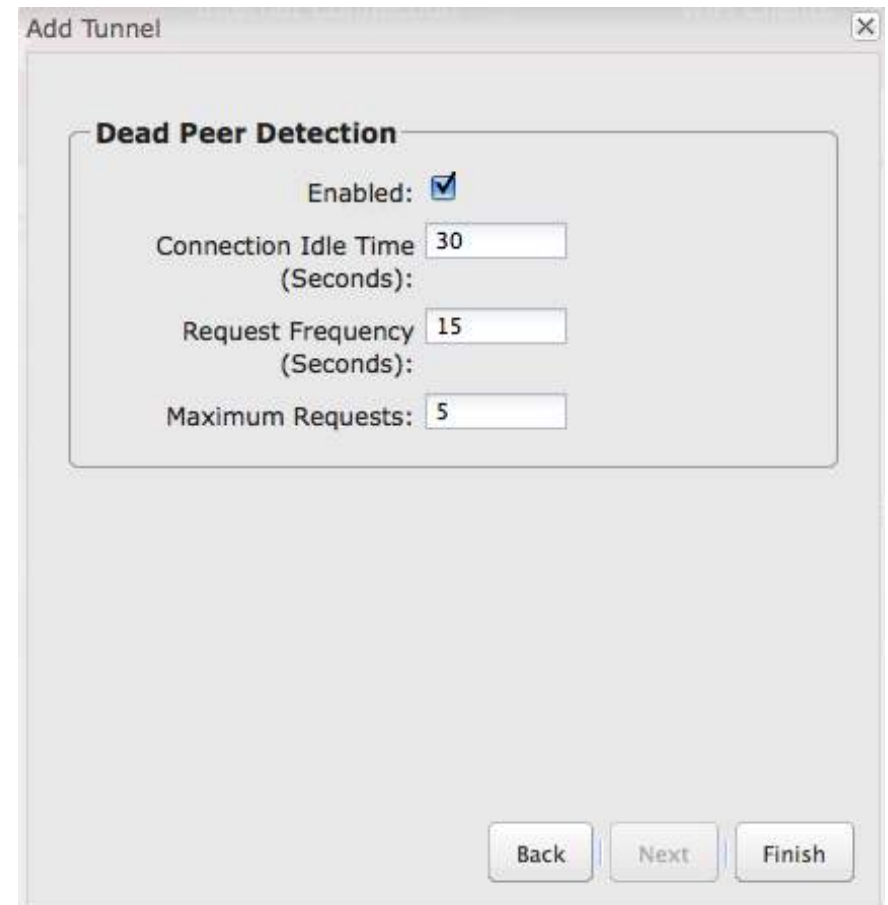

**Dead Peer Detection (DPD)** defines how the router will detect when one end of the IPsec session loses connection while a policy is in use.

**Connection Idle Time** allows you to configure how long the router will allow an IPsec session to be idle before beginning to send Dead Peer Detection (DPD) packets to the peer machine.

**Request Frequency** allows you to adjust the delay between these DPD packets to send as quickly as every 2 seconds up to 30 seconds apart.

Additionally, you can specify how many **Maximum Requests** to send at the selected time interval before the tunnel is considered dead.

You must click **Finish** to save your VPN tunnel.

The screenshot shows a window titled "Add Tunnel" with a close button (X) in the top right corner. Inside the window, there is a section titled "Dead Peer Detection" with a rounded border. The settings are as follows:

- Enabled:
- Connection Idle Time (Seconds):
- Request Frequency (Seconds):
- Maximum Requests:

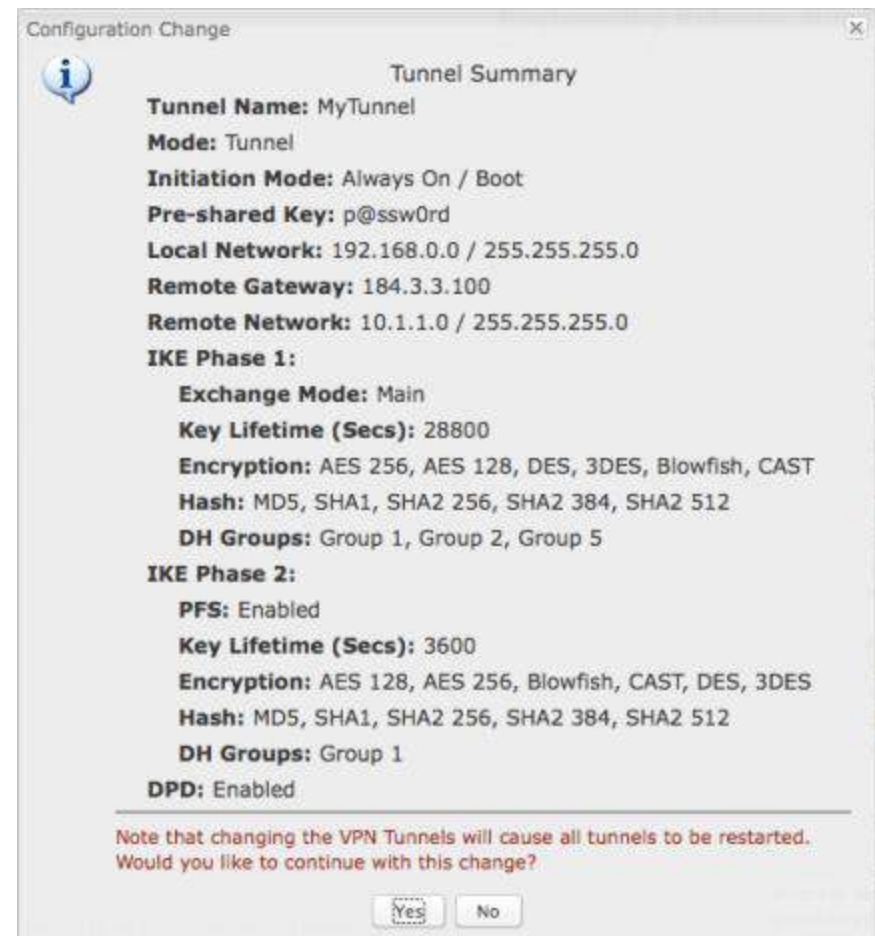

At the bottom right of the window, there are three buttons: "Back", "Next", and "Finish".

#### 7.4.6 Page 6: Tunnel Summary

The final page of the tunnel configuration interface is a summary of the tunnel specifications. This is especially helpful for matching this information with the router (or similar device) at the other end of the tunnel.

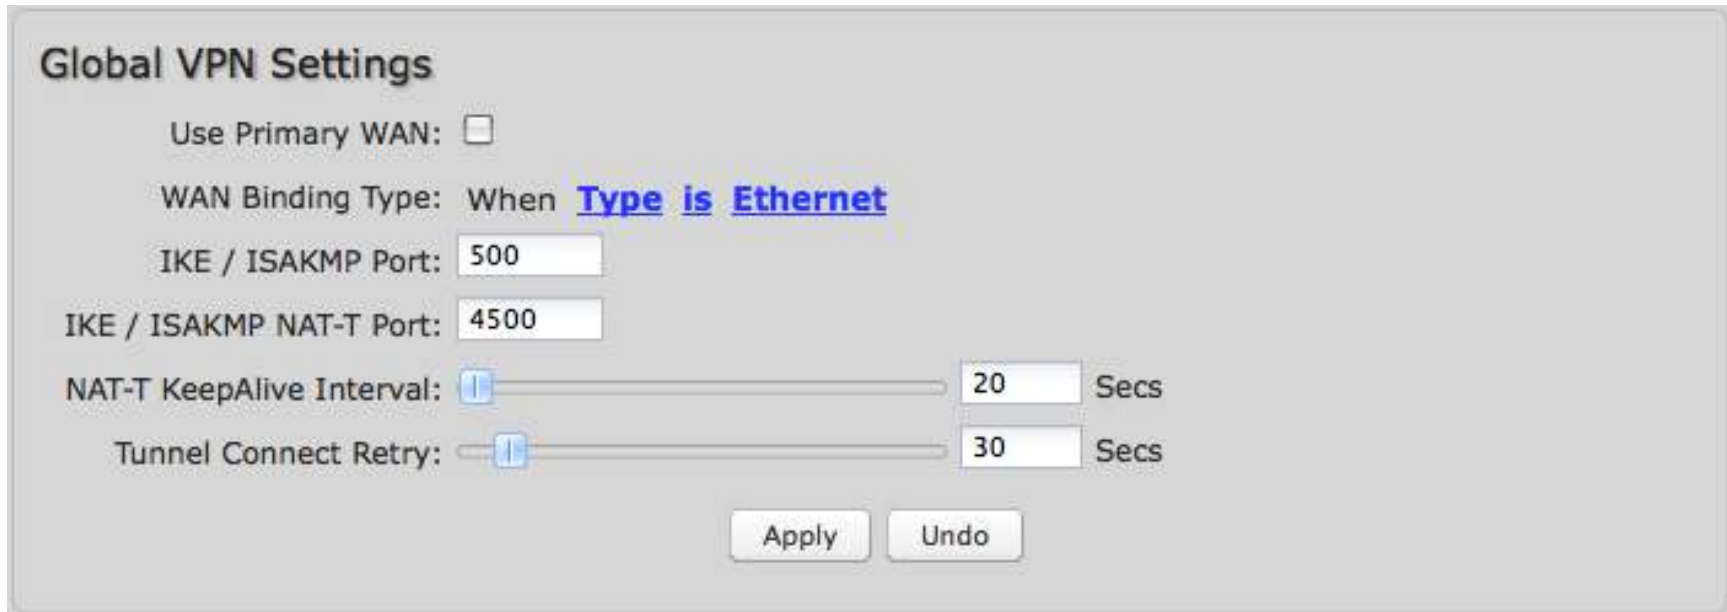

- Tunnel Name
- Mode
- Initiation Mode
- Pre-shared Key
- Local Network
- Remote Gateway
- Remote Network
- IKE Phase 1:
  - Exchange Mode
  - Key Lifetime (Secs)
  - Encryption
  - Hash
  - DH Groups
- IKE Phase 2:
  - PFS
  - Key Lifetime (Secs)
  - Encryption
  - Hash
  - DH Groups
- DPD

Click **Yes** at the bottom of the Tunnel Summary page to save your configuration changes. This will cause active tunnels to restart.

### 7.4.7 Global VPN Settings

These settings apply to all configured VPN tunnels.

**Global VPN Settings**

Use Primary WAN:

WAN Binding Type: When **Type is Ethernet**

IKE / ISAKMP Port:

IKE / ISAKMP NAT-T Port:

NAT-T KeepAlive Interval:   Secs

Tunnel Connect Retry:   Secs

**Use Primary WAN:** (Default: Selected.) Deselect to open options for specifying the WAN type. By default, VPN will use the primary WAN for connection, which will allow it to failover to other WANs as needed. If VPN needs to be tied to a particular WAN, deselect the box and selecting the appropriate WAN.

**WAN Binding Type:** You have several options for specifying the type of WAN interface(s) you want associated with GRE Tunnels. Designate the interface(s) by **Port**, **Manufacturer**, **Model**, **Type**, **Serial Number**, **MAC Address**, or **Unique ID**. This selection will create a dropdown list of options to complete a sentence with the following form: “When \_\_\_\_\_ is \_\_\_\_\_,” such as, “When TYPE is LTE.” You also have the option to replace “is” with “isn’t,” “starts with,” “ends with,” or “contains.”

- **Port:** Select from the dropdown list of possible WAN ports on the router.
  - LAN Ethernet
  - USB

- ExpressPort
- **Manufacturer:** Select from a dropdown list of attached devices.
- **Model:** Select from a dropdown list of attached devices.
- **Type:** Select from the dropdown list of possible WAN types.
  - WiMAX
  - Modem
  - LTE
  - Ethernet
  - Wireless As WAN
- **Serial Number:** Select from a dropdown list of attached devices.
- **MAC Address:** Select from a dropdown list of attached devices.
- **Unique ID:** Select from a dropdown list of attached devices.

**IKE / ISAKMP Port:** Internet Key Exchange / Internet Security Association and Key Management Protocol port. Default: 500. This is a standard VPN port that usually does not need to be changed.

**IKE / ISAKMP NAT-T Port:** Internet Key Exchange / Internet Security Association and Key Management Protocol network address translation traversal port. Default: 4500. This is a standard VPN NAT-T port that usually does not need to be changed.

**NAT-T KeepAlive Interval:** Default: 20 seconds. Range: 0-3600 seconds. 20 seconds will be sufficient in almost all cases.

**Tunnel Connect Retry:** Default: 30 seconds. Range: 10-255 seconds. 30 seconds will be sufficient in almost all cases.

#### 7.4.8 VPN with NAT-T

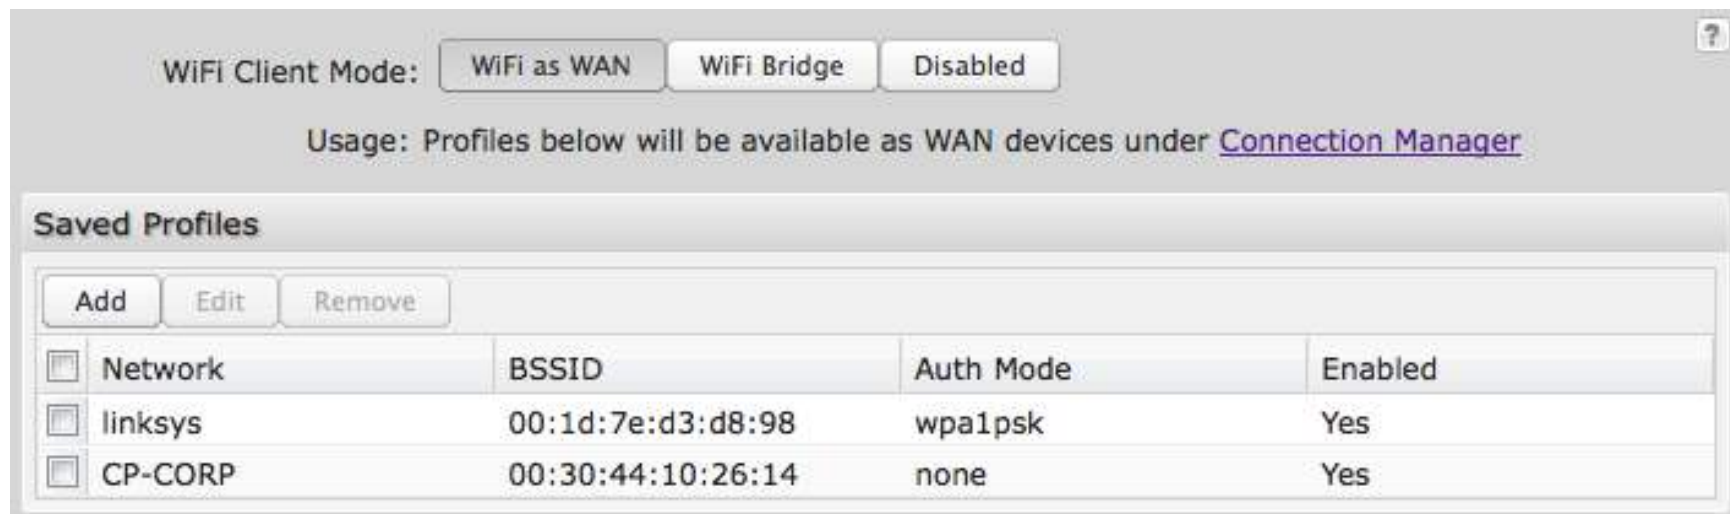

If one side of a planned VPN tunnel is behind a NAT (network address translation) firewall, the setup of your tunnel requires the following specifications:

1. Each side of the tunnel must use both a **Local Identity** and a **Remote Identity**. These must match the identities on the other side: The Local Identity must match the Remote Identity on the other side of the tunnel, and vice versa. In this case, these identities can each be a simple word.
2. The **Tunnel Name** for the side of the tunnel that is not behind the NAT firewall must be “anonymous”.
3. The VPN tunnel must be initiated from the side that is behind the NAT firewall.

## 7.5 WiFi as WAN / Bridge

**WiFi as WAN** uses another WiFi network as its Internet source and then rebroadcasts its own local network. For example, the CBR400 can create a private LAN using the public WiFi from a hotel as its WAN. **WiFi Bridge** functions similarly, but it rebroadcasts the original network. In other words, the router passes on the same settings and addresses already set up by the original NAT. **The WiFi as WAN and WiFi Bridge features cannot both be used at the same time.**

When either **WiFi as WAN** or **WiFi Bridge** is enabled, the CBR400 will find other WiFi networks that you can select and connect to. Unless a selected WiFi source is on an unprotected network, you will need to know its password or key.

WiFi Client Mode:  WiFi as WAN  WiFi Bridge  Disabled

Usage: Profiles below will be available as WAN devices under [Connection Manager](#)

**Saved Profiles**

<input type="checkbox"/>	Network	BSSID	Auth Mode	Enabled
<input type="checkbox"/>	linksys	00:1d:7e:d3:d8:98	wpa1psk	Yes
<input type="checkbox"/>	CP-CORP	00:30:44:10:26:14	none	Yes

All CradlePoint routers and some other routers use the same default IP address for the primary network, 192.168.0.1. If you attempt to set up WiFi as WAN and there is an “IP conflict,” you need to change the IP address. The router is attempting to use the same IP address for both WAN and LAN, which is impossible. Go to **Network Settings → WiFi / Local Networks. Select the network and click Edit. You can change the IP address under IP Settings. For example, you might change 192.168.0.1 to 192.168.1.1.**

### 7.5.1 WiFi Bridge

When in **WiFi Bridge** mode with a configured profile, a WiFi Bridge device will be added to the local network interfaces, providing a way to bridge two LANs over a WiFi connection. For example, two separate CradlePoint routers linked through WiFi Bridge mode allows you to have one WiFi-connected network in two separated sections of a large office building. This eliminates the need for extensive Ethernet cords to link the two routers, while allowing the full functionality of having one network.

A router that is using Bridge mode passes network information through from the partner access point, so typically DHCP and NAT should be disabled. The router will connect to the remote WiFi access point and enable the bridging of two LAN networks together over WiFi.

Under **Network Settings** → **WiFi / Local Networks**, choose the Local IP Network you want to attach this LAN interface to. Edit that Network, and under the "Interfaces" tab you will be able to see your WiFi Bridge profiles as "Available" interfaces.

NOTE: The LAN IP address of this router and the attached WiFi access point cannot be the same address.

To set up WiFi Bridge, follow these steps:

- 1) In **Internet** → **WiFi as WAN / Bridge** under **WiFi Client Mode**, click on "WiFi Bridge" to enable this mode.
- 2) Your bridge network must be enabled under **Saved Profiles**. Either import the desired network from **Site Survey** or click **Add** to configure it.
- 3) Once WiFi Bridge is enabled and a bridge network is configured in **Saved Profiles**, go to **Network Settings** → **WiFi / Local Networks** and select a network from the Local IP Networks list. Click on **Edit** to open the **Local Network Editor** and find the **Interfaces** tab. Your configured bridge network should be listed in the "Available" section. Add this interface to your chosen network.
- 4) You need to turn off the DHCP Server. If you click **Submit** after attaching the WiFi bridge interface, a window will pop up asking you if you want to turn off the DHCP Server. You can also do this manually: click on the **DHCP Server** tab while still under **Network Settings** → **WiFi / Local Networks** in the **Local Network Editor**. Deselect "DCHP Server" to disable it.
- 5) Optional: Also under **Network Settings** → **WiFi / Local Networks** in the **Local Network Editor**, click on the **IP Settings** tab. Change the **Routing Mode** to "Disabled." Changing the routing mode may improve security. You may also need to change the IP address to prevent IP conflict. Click **Submit** to save your configuration.

### 7.5.2 Saved Profiles

This is a list of WiFi networks that have already been configured as WAN sources (or Bridge profiles). The router will attempt to connect to any of these access points using the password you have configured. If more than one access point is in range, then the router will connect with the highest priority network.

Network	BSSID	Auth Mode	Enabled
<input type="checkbox"/> linksys	00:1d:7e:d3:d8:98	wpa1psk	Yes

**Network:** The name (SSID, or Service Set Identifier) that is broadcast by the access point.

**BSSID:** The numeric ID of the network (Basic Service Set Identifier). This parameter is required when trying to connect to a hidden network using WiFi as WAN. It is optional when connecting to a visible network. If it is set in a profile, both the SSID and BSSID must match to connect to an access point. If the BSSID is not set in a profile, then the router will connect to any access point that matches the given SSID.

**Auth Mode:** The type of encryption that is used by the network.

- None
- WEP Auto
- WEP Open
- WEP Shared
- WPA1 Personal
- WPA2 Personal
- WPA1 & WPA2 Personal

### 7.5.3 Site Survey

This is a list of WiFi networks that the router can currently find, along with information about the network such as its mode and channel. If you click on a network in the **Site Survey**, you can import it as a saved profile. You can sort the list based on any of the fields by clicking on the field name.

Click “Refresh” if a WiFi network to which you want to connect is invisible. **Site Survey** only operates on the 2.4 GHz band.

You have the option to manually add network profiles, but it is usually much easier to import them from **Site Survey**. Either click on **Add** under “**Saved Profiles**” or select a WiFi network in “**Site Survey**” and click **Import**.

If you import a network from **Site Survey**, most of the information about the network will already be completed. You need to input the password (if there is one) and then click submit to save the WiFi as WAN profile.

Site Survey - Configured for networks in the 2.4Ghz band

Refresh Import

<input type="checkbox"/>	Network	BSSID	RSSI -	Mode	Auth Mode	Channel
<input type="checkbox"/>	CP-CORP	00:30:44:0f:e6:b7	-64	b/g/n	wpa1/tkipaes	11
<input type="checkbox"/>	CP-CORP	00:30:44:0f:e8:52	-76	b/g/n	wpa1/tkipaes	11
<input type="checkbox"/>	MBR1200-578	00:30:44:08:e5:78	-78	b/g/n	none	5
<input type="checkbox"/>	MBR1400-858	00:30:44:0f:e8:58	-80	b/g/n	wpa1wpa2psk/aes	2
<input type="checkbox"/>	MBR1400-79c	00:30:44:0d:97:9c	-80	b/g/n	wpa1wpa2psk/aes	3
<input type="checkbox"/>	MBR1400-748	00:30:44:0d:97:48	-84	b/g/n	wpa1wpa2psk/aes	6
<input type="checkbox"/>	MBR1200-4ac	00:30:44:09:14:ac	-86	b/g/n	wpa2psk/aes	2
<input type="checkbox"/>	MBR1400-42f	00:30:44:10:24:2f	-86	b/g/n	wpa1wpa2psk/aes	3

#### 7.5.4 Wireless Scan Settings

**Wireless Scan Settings**

Scan Interval:  seconds

Scan While Connected:

Apply Undo

**Scan Interval:** How often WiFi as WAN scans the environment for updates. (Default: 60 seconds. Range: 5-3600 seconds.)

**Scan While Connected:** Continue to scan for WiFi as WAN profile updates when connected. Each time a scan occurs the wireless communication of the router will be temporarily interrupted. Normally this should be disabled.

## 7.6 WAN Affinity

WAN Affinity rules allow you to manage traffic in your network so that particular bandwidth uses are associated with particular WAN sources. This allows you to prioritize bandwidth.

EXAMPLE: You could specify that your guest LAN is only associated with your Ethernet connection with no failover. Then if your Ethernet connection goes down and the embedded modem connects for failover for your primary LAN, your guest LAN will not take bandwidth from your primary LAN, saving you money.

Click “Add” to open the WAN Affinity Policy Editor and create a new WAN Affinity rule.

**Name:** Give a name for your rule that is meaningful to you.

**Protocol:** Select from the dropdown list to specify the protocol for a particular data use. Otherwise, leave “Any” selected.

- Any
- ICMP
- TCP
- UDP
- GRE
- ESP
- SCTP

**Source IP Address, Source Netmask, Destination IP Address, and Destination Netmask:** Specify an IP address or range of IP addresses by combining an IP address with a netmask for either “source” or “destination” (or both). Source vs.

**WAN Affinity Policy Editor** ✕

NOTE: WAN affinity policies only apply to network traffic that is routed through the router. Any network services that terminate on the router itself or are initiated from the router are not controlled with affinity policies. Some services such as VPN and GRE tunnels have their own mechanism for dictating the WAN device they use, but this will be controlled from their respective config pages.

Also note that FTP and PPTP have limited interaction with affinity policies due to the application-level-gateway routines used to route them properly.

Name:

Protocol:  ▾

Source IP Address:  .  .  .

Source Netmask:  .  .  .   ▾

Destination IP Address:  .  .  .

Destination Netmask:  .  .  .   ▾

Destination Port(s):  :

Failover:

WAN Binding Type: When **Unique ID is (empty)**

destination is defined by traffic flow. Leave these blank to include all IP addresses (such as if your rule is defined by a particular port instead).

EXAMPLE: If you want to associate this rule with your guest LAN, you could input the IP address and netmask for the guest LAN here (leaving the last slot "0" to allow for any user attached to the guest network):

- **Source IP Address:** 192.168.10.0
- **Source Netmask:** 255.255.255.0

**Destination Port(s):** Enter a port number between 1 and 65535. To enter a single port number, input the number into the left box. To enter a range of ports, fill in both boxes separated by the colon. For example "80:90" would represent all ports between 80 and 90 including 80 and 90 themselves.

**Failover:** (Default: Selected.) When this is selected and traffic from the chosen WAN device for this rule is interrupted, the router will fail over to another available WAN device. Deselect this option to restrict this traffic to only the selected WAN interface.

**WAN Binding Type:** You have several options for specifying the type of WAN interface(s) you want associated with your rule. Designate the interface(s) by **Port**, **Manufacturer**, **Model**, **Type**, **Serial Number**, **MAC Address**, or **Unique ID**. This selection will create a dropdown list of options to complete a sentence with the following form: "When \_\_\_\_\_ is \_\_\_\_\_," such as, "When Type is LTE." You also have the option to replace "is" with "isn't," "starts with," "ends with," or "contains."

- **Port:** Select from the dropdown list of possible WAN ports on the router.
  - LAN Ethernet
  - USB
  - ExpressPort
- **Manufacturer:** Select from a dropdown list of attached devices.
- **Model:** Select from a dropdown list of attached devices.
- **Type:** Select from the dropdown list of possible WAN types.
  - WiMAX
  - Modem
  - LTE
  - Ethernet
  - Wireless As WAN
- **Serial Number:** Select from a dropdown list of attached devices.

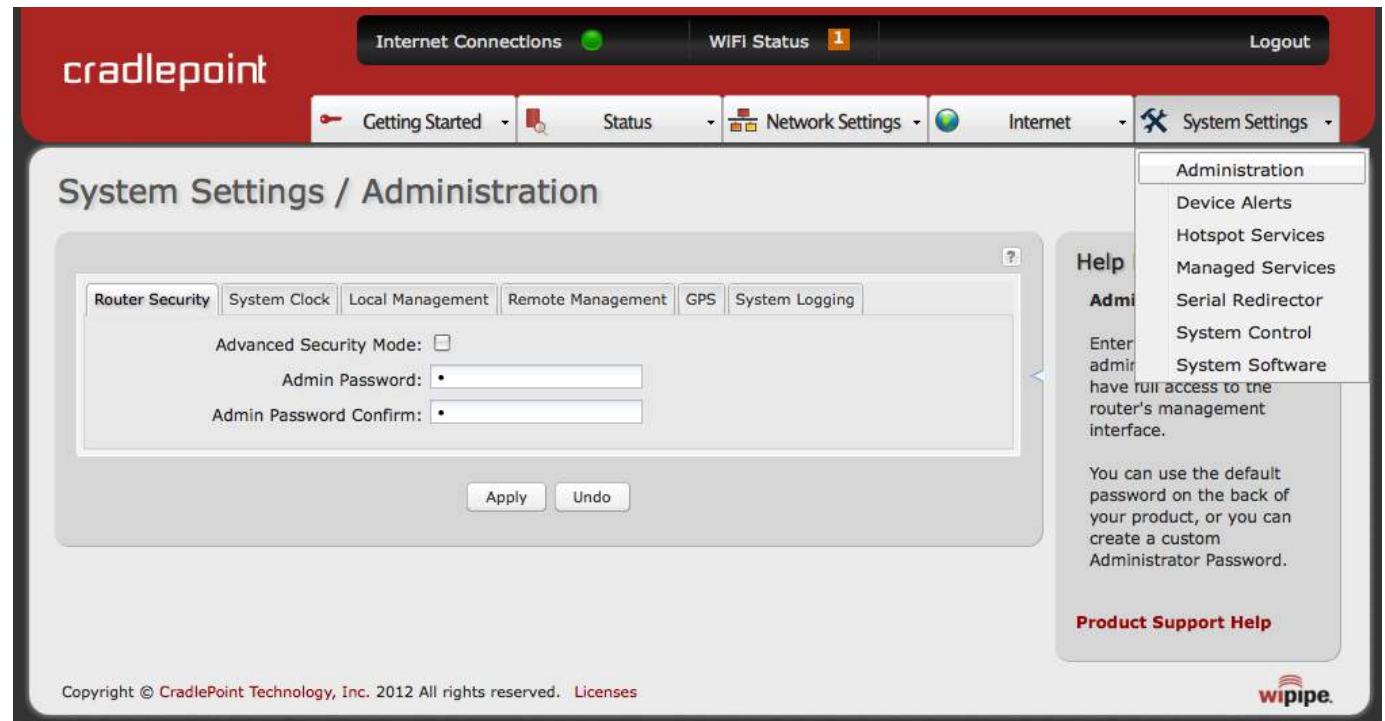

- **MAC Address:** Select from a dropdown list of attached devices.
- **Unique ID:** Select from a dropdown list of attached devices.

## 8 SYSTEM SETTINGS

The System Settings tab has 7 submenu items that provide access to tools for broad administrative control of the CBR400:

- Administration
- Device Alerts
- Hotspot Services
- Managed Services
- Serial Redirector
- System Control
- System Software

The screenshot displays the Cradlepoint web interface for System Settings / Administration. The top navigation bar includes 'Internet Connections', 'WiFi Status', and 'Logout'. The main menu shows 'Getting Started', 'Status', 'Network Settings', 'Internet', and 'System Settings'. The 'System Settings / Administration' page is active, with a sub-menu for 'Administration' showing options: Router Security, System Clock, Local Management, Remote Management, GPS, and System Logging. The 'Router Security' section is selected, showing 'Advanced Security Mode' (unchecked), 'Admin Password' and 'Admin Password Confirm' fields, and 'Apply' and 'Undo' buttons. A help sidebar on the right provides instructions on administrator access and password requirements.

**Help**

**Admin**

Enter admin... have full access to the router's management interface.

You can use the default password on the back of your product, or you can create a custom Administrator Password.

**Product Support Help**

Copyright © CradlePoint Technology, Inc. 2012 All rights reserved. Licenses

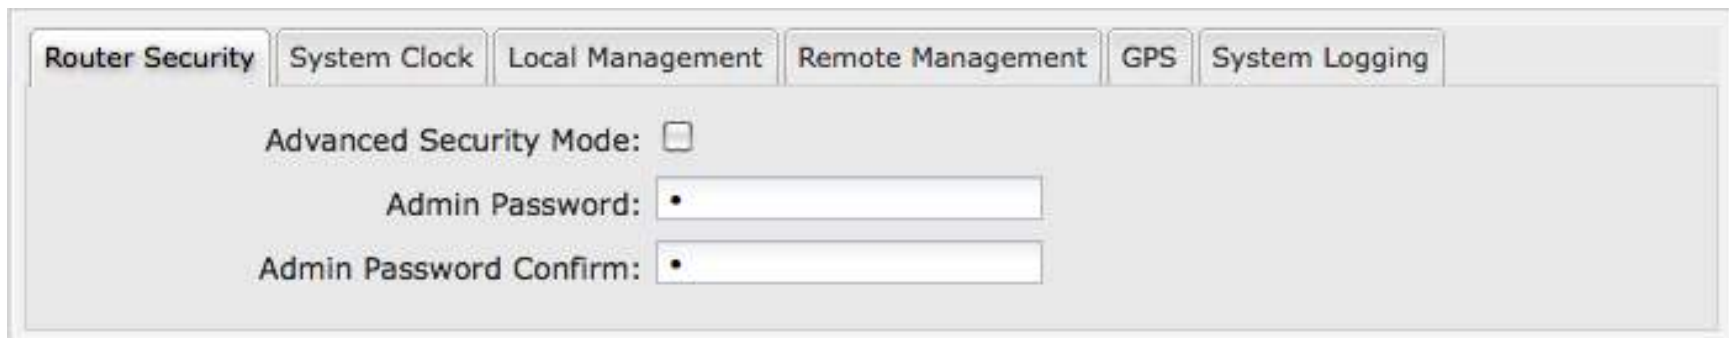

wipipe.

## 8.1 Administration

Select the Administration submenu item in order to control any of the following functions:

- Router Security
- System Clock
- Local Management
- Remote Management
- GPS
- System Logging

### 8.1.1 Router Security

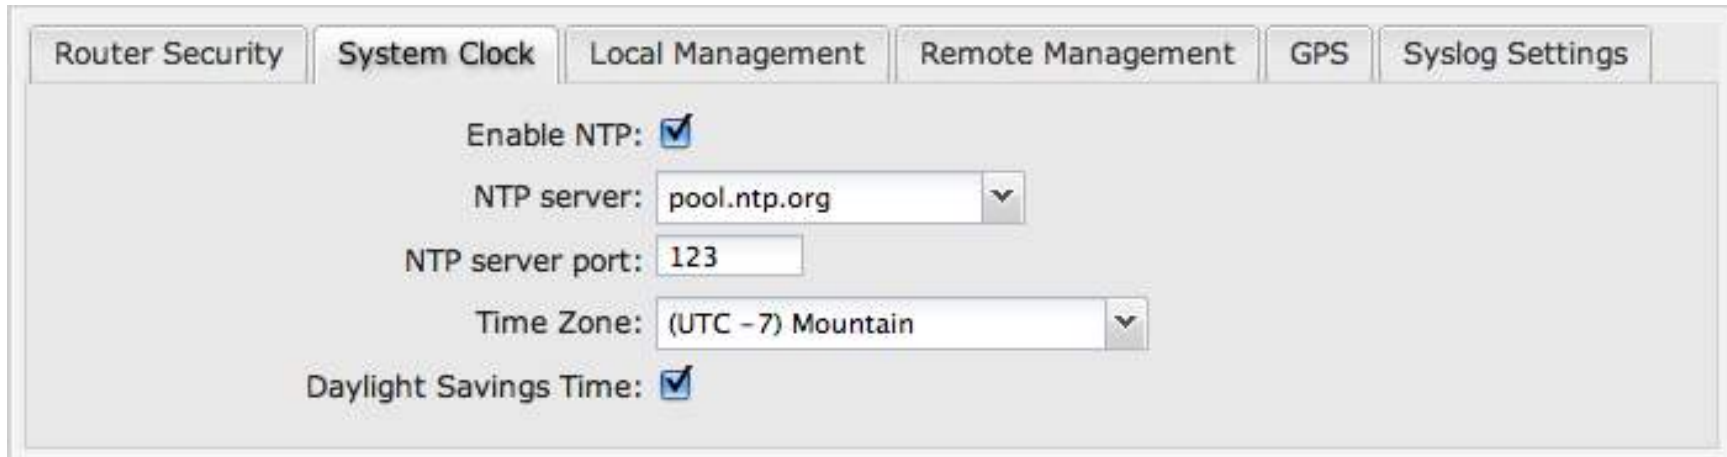

The screenshot shows a configuration page for Router Security. At the top, there are six tabs: Router Security (selected), System Clock, Local Management, Remote Management, GPS, and System Logging. Below the tabs, there is a checkbox for "Advanced Security Mode" which is currently unchecked. Underneath, there are two password input fields: "Admin Password" and "Admin Password Confirm", both containing masked characters (dots).

**Advanced Security Mode:** When the router is configured to use the advanced security mode, several aspects of the router's configuration and networking functionality will be extended to support high security environments. This includes support for multiple user accounts, increased password security, and additional network spoofing filters. If you plan to use your router in a PCI DSS compliant environment this option is mandatory.

**Admin Password:** Enter a password for the administrator who will have full access to the router's management interface. You can use the default password on the back of your product, or you can create a custom Administrator Password.

## 8.1.2 System Clock

Router Security System Clock Local Management Remote Management GPS Syslog Settings

Enable NTP:

NTP server: pool.ntp.org

NTP server port: 123

Time Zone: (UTC -7) Mountain

Daylight Savings Time:

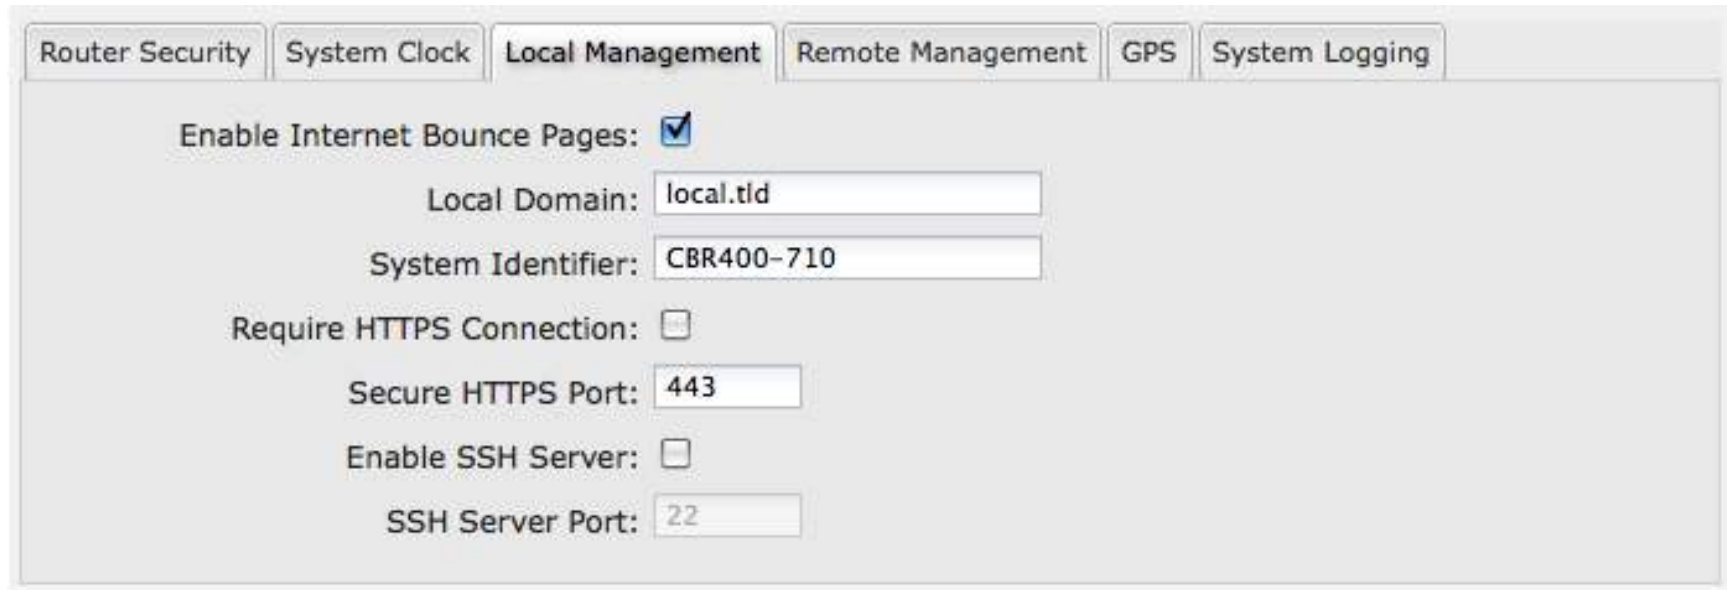

Enabling NTP will tell the router to get its system time from a remote server on the Internet. If you do not enable NTP then the router time will be based on when the router firmware was built, which is guaranteed to be wrong. Whenever the Internet connection is re-established and once a week thereafter the router will ask the server for the current time so it can correct itself.

You then have the option of selecting an NTP server and adjusting the NTP server port. Select the NTP server from the dropdown list. Any of the given NTP servers will be sufficient unless, for example, you need to synchronize your router's time with other devices in a network.

**Time Zone:** Select from a dropdown list. Setting your Time Zone is required to properly show time in your router log.

**Daylight Savings Time:** Select this checkbox if your location observes daylight savings time.

### 8.1.3 Local Management

Router Security System Clock **Local Management** Remote Management GPS System Logging

Enable Internet Bounce Pages:

Local Domain:

System Identifier:

Require HTTPS Connection:

Secure HTTPS Port:

Enable SSH Server:

SSH Server Port:

**Enable Internet Bounce Pages:** Bounce pages show up in your web browser when the router is not connected to the Internet. They inform you that you are not connected and try to explain why. If you disable bounce pages then you will just get the usual browser timeout. In the normal case when the router is connected to the Internet you don't see them at all.

**Local Domain:** The local domain is used as the suffix for DNS entries of local hosts. This is tied to the hostnames of DHCP clients as DHCP\_HOSTNAME.LOCAL\_DOMAIN.

**System Identifier:** This is a customizable identity that will be used in router reporting and alerting. The default value is the MAC address of the router.

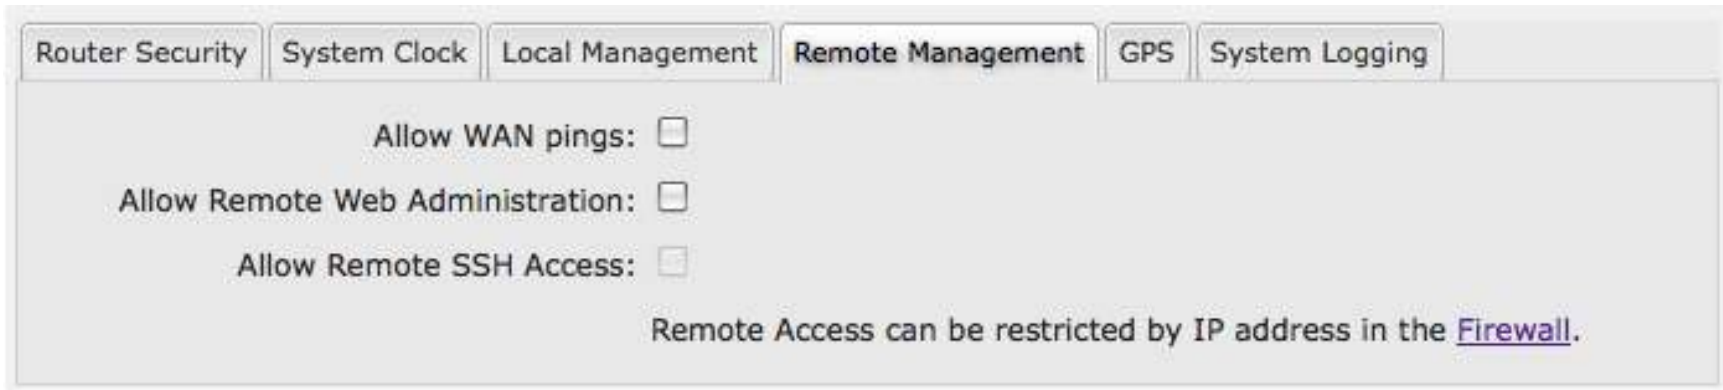

**Require HTTPS Connection:** Check this box if you want to encrypt all router administration communication.

**Secure HTTPS Port:** Enter the port number you want to use. The default is 443.

**Enable SSH Server:** When the router's SSH server is enabled you may access the router's command line interface (CLI) using the standards based SSH protocol. Use the username "admin" and the standard system password to login.

**SSH Server Port:** Enter the port number you want to use. The default is 22.

#### 8.1.4 Remote Management

Router Security System Clock Local Management **Remote Management** GPS System Logging

Allow WAN pings:

Allow Remote Web Administration:

Allow Remote SSH Access:

Remote Access can be restricted by IP address in the [Firewall](#).

Allows a user to enable incoming WAN pings or to change settings for the router from the Internet using the router's Internet address.

**Allow WAN pings:** When enabled the functionality allows an external WAN client to ping the router.

**Allow Remote Web Administration:** When remote administration is enabled it allows access to these administration web pages from the Internet. With it disabled, you must be a client on the local network to access the administration website. For security, remote access is usually done via a non-standard http port. Additionally, encrypted connections can be required for an added level of security.

- **Require HTTPS Connection:** Requiring a secure (**https**) connection is recommended.
- **HTTP Port:** Default: 8080. This option is disabled if you select "Require Secure Connection".
- **Secure HTTPS Port:** Default: 8443.

**Enable SSH Server:** When the router's SSH server is enabled you may access the router's command line interface (CLI) using the standards based SSH protocol. Use the username "admin" and the standard system password to login.

- **SSH Server Port:** Default: 22.
- **Allow Remote SSH Access:** Only enable this option if instructed by a CradlePoint support agent.

NOTE: You can restrict remote access to only specified IP addresses in [Network Settings → Firewall](#) under Remote Administration Access Control.

### 8.1.5 GPS

Router Security System Clock Local Management Remote Management **GPS** System Logging

Enable GPS support:

Enable GPS server on WAN:

Enable GPS server on LAN:

GPS server port number:

Enable GPS reporting to remote server:

Remote server hostname or IP:

Remote server port:

Report only over specific time interval:

If you have an attached device with GPS support, you can enable a graphical view of your router's location which will appear in [Status → GPS](#).

Users can configure GPS NMEA GGA format sentence reporting, available through a router-based server and/or a remote server.

NOTE: Some carriers disable GPS support in otherwise supported modems. If you encounter issues with obtaining a fix, contact your carrier and ensure that GPS is supported.

- **Enable GPS support:** Enables support for querying GPS information from supported modems.

- **Active GPS:** Keep the GPS receiver active at all times, even if no destination exists for position messages. This will place additional load on the router similar to sending reports to a remote server, but without consuming the network bandwidth.
- **Enable GPS server on WAN:** Enables a server on the WAN side of the firewall which will periodically send GPS NMEA sentences to TCP connected clients. It also responds to incoming UDP datagrams.
- **Enable GPS server on LAN:** Enables a server on the LAN side of the firewall which will periodically send GPS NMEA sentences to TCP connected clients. It also responds to incoming UDP datagrams.
  - **GPS server port number**
- **Enable GPS reporting to remote server:** Enables periodic reporting of GPS NMEA sentences to a remote server. The router will buffer NMEA data if errors are encountered or if the Internet connection goes down and send the buffered sentences when the connection is restored.
  - **Remote server hostname or IP**
  - **Remote server port**
  - **Report only over specific time interval:** Restricts the NMEA sentence reporting to a remote server to a specific time interval.

The following GPS spec is copied from <http://aprs.gids.nl/nmea/>

#### 8.1.6 \$GPGGA – Global Positioning System Fix Data

Name	Example Data	Description
Sentence Identifier	\$GPGGA	Global Positioning System Fix Data
Time	170834	17:08:34 Z
Latitude	4124.8963, N	41d 24.8963' N or 41d 24' 54" N
Longitude	08151.6838, W	81d 51.6838' W or 81d 51' 41" W
Fix Quality: - 0 = Invalid	1	Data is from a GPS fix

- 1 = GPS fix - 2 = DGPS fix		
Number of Satellites	05	5 Satellites are in view
Horizontal Dilution of Precision (HDOP)	1.5	Relative accuracy of horizontal position
Altitude	280.2, M	280.2 meters above mean sea level
Height of geoid above WGS84 ellipsoid	-34.0, M	-34.0 meters
Time since last DGPS update	blank	No last update
DGPS reference station id	blank	No station id
Checksum	*75	Used by program to check for transmission errors

Courtesy of [Brian McClure](#), N8PQI.

Global Positioning System Fix Data. Time, position, and fix related data for a GPS receiver.

eg2. \$--GGA,hhmmss.ss,llll.ll,a,yyyyy.yy,a,x,xx,x.x,x.x,M,x.x,M,x.x,xxxx

- hhmmss.ss = UTC of position
- llll.ll = latitude of position
- a = N or S
- yyyyy.yy = Longitude of position
- a = E or W
- x = GPS Quality indicator (0=no fix, 1=GPS fix, 2=Dif. GPS fix)
- xx = number of satellites in use
- x.x = horizontal dilution of precision
- x.x = Antenna altitude above mean-sea-level

M = units of antenna altitude, meters

x.x = Geoidal separation

M = units of geoidal separation, meters

x.x = Age of Differential GPS data (seconds)

xxxx = Differential reference station ID

eg3. \$GPGGA,hhmmss.ss,llll.ll,a,yyyy.yy,a,x,xx,x.x,x.x,M,x.x,M,x.x,xxxx\*hh

1 = UTC of Position

2 = Latitude

3 = N or S

4 = Longitude

5 = E or W

6 = GPS quality indicator (0=invalid; 1=GPS fix; 2=Diff. GPS fix)

7 = Number of satellites in use [not those in view]

8 = Horizontal dilution of position

9 = Antenna altitude above/below mean sea level (geoid)

10 = Meters (Antenna height unit)

11 = Geoidal separation (Diff. between WGS-84 earth ellipsoid and mean sea level. -=geoid is below WGS-84 ellipsoid)

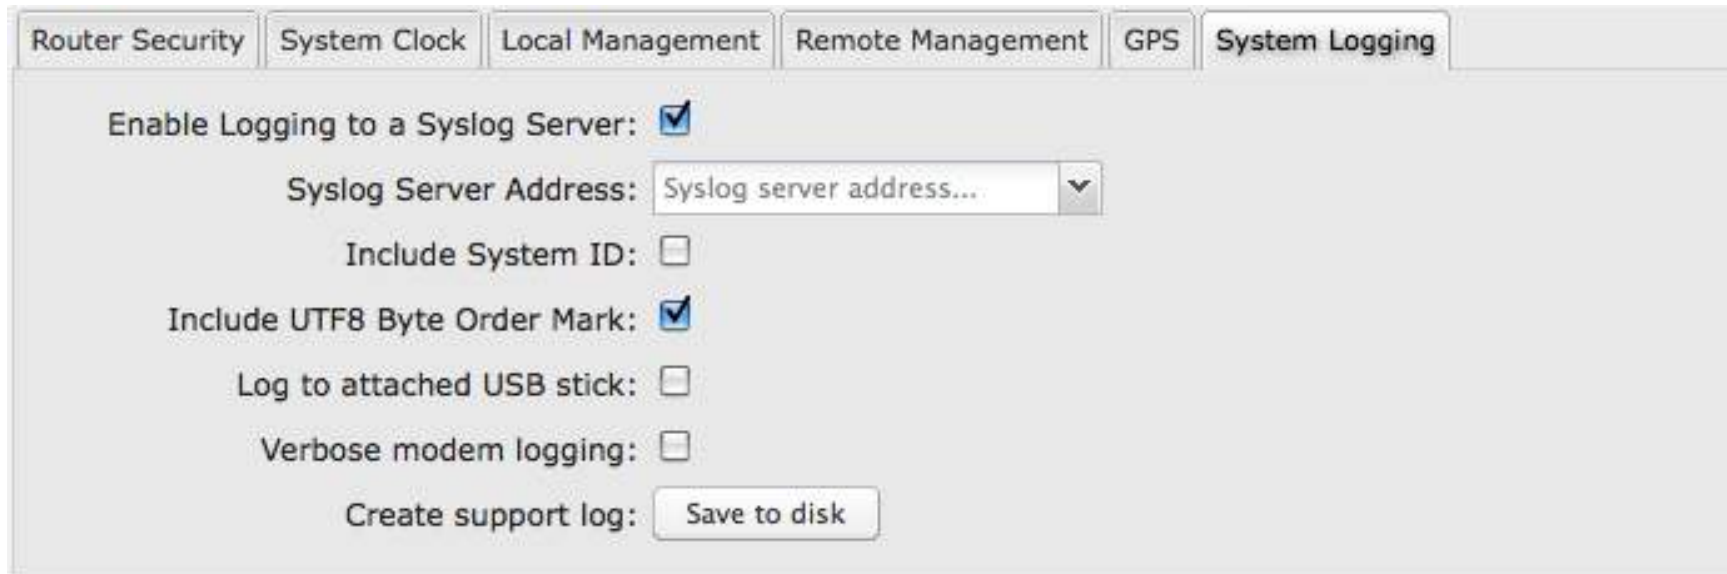

12 = Meters (Units of geoidal separation)

13 = Age in seconds since last update from diff. reference station

14 = Diff. reference station ID#

15 = Checksum

### 8.1.7 System Logging

**Enable Logging to a Syslog Server:** Enabling this option will send log messages to a specified Syslog server. After enabling, type the Hostname or IP address of the Syslog server (or select from the dropdown menu).

**Syslog Server Address:** Select the Hostname or IP address from the dropdown menu, or type this in manually.

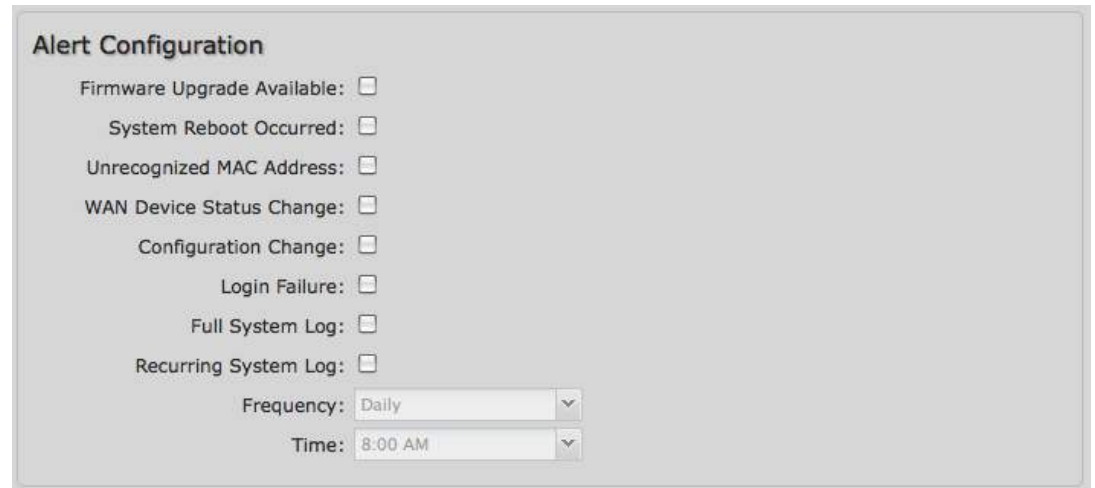

**Include System ID:** This option will include the router's "System ID" at the beginning of every log message. This is often useful when a single remote Syslog server is handling logs for several routers.

**Include UTF8 Byte Order Mark:** The log message is sent using UTF-8 encoding. By default the router will attach the Unicode Byte Order Mark (BOM) to the Syslog message in compliance with the Syslog protocol, RFC5424. Some Syslog servers may not fully support RFC5424 and will treat the BOM as ASCII text, which will appear as garbled characters in the log. If this occurs, disable this option.

**Log to attached USB stick:** Only enable this option if instructed by a CradlePoint support agent. This will write a very verbose log file to the root level of an attached USB stick. Please disable the feature before removing the USB stick, or you may lose some logging data.

**Verbose modem logging:** Only enable this option if instructed by a CradlePoint support agent.

**Create support log:** This functionality allows for a quick collection of system logging. Create this log file when instructed by a CradlePoint support agent.

The screenshot shows the 'Alert Configuration' interface. It contains several checkboxes for enabling alerts: Firmware Upgrade Available, System Reboot Occurred, Unrecognized MAC Address, WAN Device Status Change, Configuration Change, Login Failure, Full System Log, and Recurring System Log. At the bottom, there are two dropdown menus: 'Frequency' set to 'Daily' and 'Time' set to '8:00 AM'.

## 8.2 Device Alerts

The Device Alerts submenu choice allows you to receive email notifications of specific system events. **YOU MUST ENABLE AN SMTP EMAIL SERVER TO RECEIVE ALERTS.** Alerts can be included for the following:

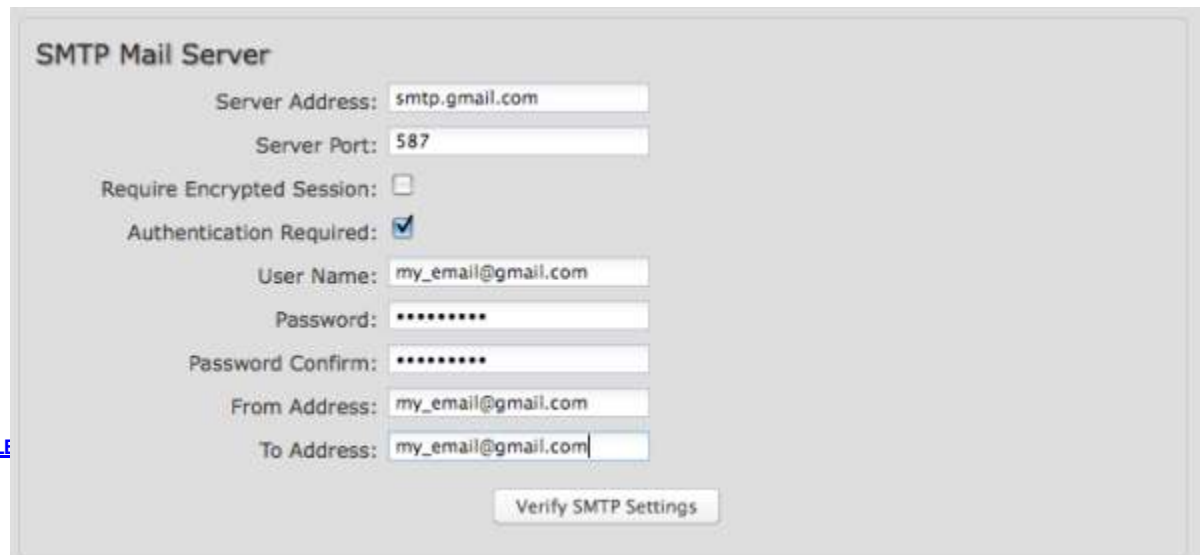

- **Firmware Upgrade Available:** A firmware update is available for this device.
- **System Reboot Occurred:** This router has rebooted. This depends on NTP being enabled and available to report the correct time.
- **Unrecognized MAC Address:** Used with the MAC monitoring lists. An alert is sent when a new unrecognized MAC address is connected to the router.
- **WAN Device Status Change:** An attached WAN device has changed status. The possible statuses are plugged, unplugged, connected, and disconnected.
- **Configuration Change:** A change to the router configuration.
- **Login Failure:** A failed login attempt has been detected.
- **Full System Log:** The system log has filled. This alert contains the contents of the system log.
- **Recurring System Log:** The system log is sent periodically. This alert contains all of the system events since the last recurring alert. It can be scheduled for daily, weekly and monthly reports. You also choose the time you want the Alert sent.

### 8.2.1 SMTP Mail Server

Since the CBR400 does not have its own email server, to receive alerts you must enable an SMTP server. This is possible through most email services (Gmail, Yahoo, etc.).

Each SMTP server will have different specifications for setup, so you have to look those up separately. The following is an example using Gmail:

- **Server Address:** smtp.gmail.com
- **Server Port:** 587 (for TLS, or Transport Layer Security port; the CBR400 does not support SSL).

**SMTP Mail Server**

Server Address:

Server Port:

Require Encrypted Session:

Authentication Required:

User Name:

Password:

Password Confirm:

From Address:

To Address:

- **Authentication Required:** For Gmail, mark this checkbox.
- **User Name:** Your full email address
- **Password:** Your Gmail password
- **From Address:** Your email address
- **To Address:** Your email address

Once you have filled in the information for the SMTP server, click on the “Verify SMTP Settings” button. You should receive a test email at your account.

#### Advanced: **Delivery Options**

**Email Subject Prefix:** This optional string is prefixed to the alert subject. It can be customized to help you identify alerts from specific routers.

**Retry Attempts:** The number of attempts made to send an alert to the mail server. After the attempts are exhausted, the alert is discarded.

**Retry Delay:** The delay between retry attempts.

**ADVANCED**  
**Delivery Options**

Email Subject Prefix:

Retry Attempts:

Retry Delay (Minutes):

### 8.3 Hotspot Services

Any of your networks can be enabled as a hotspot. To enable a hotspot, you need to select a network and set it as a hotspot in **Network Settings** → **WiFi / Local Networks**.

NOTE: Although any network can be a hotspot, the CBR400 allows only one hotspot.

**Hotspot Mode:** Choose from the following dropdown options:

- **Simple:** Allows “Terms of Use” page and timeout settings controlled within the router.
- **RADIUS/UAM:** Allows you to set up external authentication servers.

**Local IP Network:** A single LAN Group—including both WiFi and Ethernet—can be configured as your hotspot. If you do not already have a LAN Group configured as a hotspot, go to the [WiFi / Local Networks](#) page (you can click **Configure** to link to this page) and set the **Routing Mode** to "Hotspot" for the LAN Group you want to use.

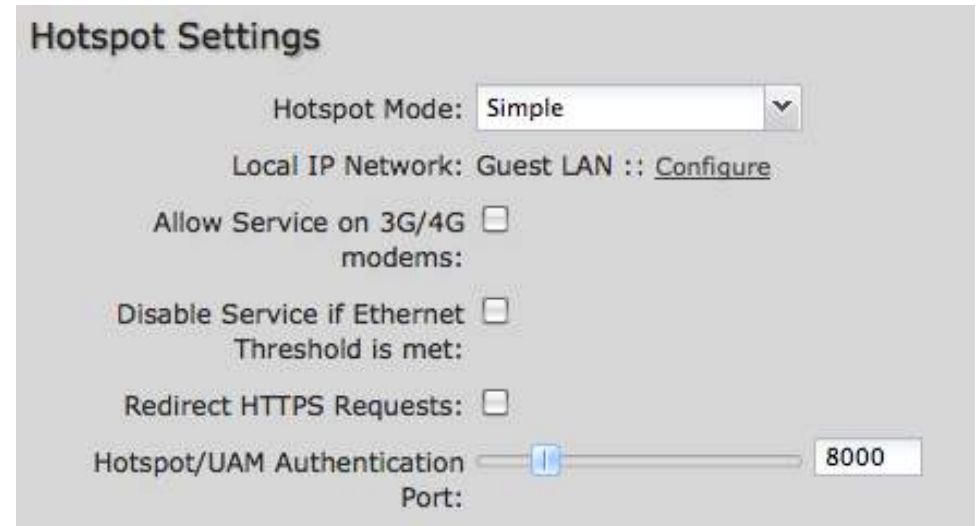

NOTE: Routing Mode is in the Local Network Editor under the IP Settings tab. Select a network in **Network Settings** → **WiFi / Local Networks** and click **Edit** to open the Local Network Editor. The IP Settings tab will already be open: the Routing Mode dropdown menu is at the bottom.

**Allow Service on 3G/4G Modems:** Allows you to enable or disable hotspot access to the Internet over a modem. This is often used if the router has a main wired link and a secondary modem for failover (typically with a more expensive/limited data plan). Select this option if you want the router to allow data traffic over the modem if the wired connection goes down.

**Disable Service if Ethernet Threshold is met:** This will block Hotspot use of the WAN when the threshold is met. This can be used if the router is being used as a backup failover connection to another router with a wired connection. If that other router’s wired connection goes down and it starts using this router for its primary connection, then disable Hotspot use of the WAN connection. Set the limiting **Rate** (KB/s) and **Time Period** (seconds).

**Redirect HTTPS Requests:** This allows initial requests to HTTPS websites to be redirected appropriately.

**Hotspot/UAM Authentication Port:** Default: 8000. Type in a different port number, or use the slider to change the port.

Hotspot Settings

Hotspot Mode: Simple

Local IP Network: Guest LAN :: [Configure](#)

Allow Service on 3G/4G modems:

Disable Service if Ethernet Threshold is met:

Redirect HTTPS Requests:

Hotspot/UAM Authentication Port: 8000

### Simple Mode Settings

Display:  ▼

Terms of Use Text:

Redirection On Successful Authentication:  ▼

Redirect URL:

Session Timeout:  60 Mins (0 = Disabled)

Idle Timeout:  15 Mins (0 = Disabled)

Bandwidth (upload):  Kbits/sec (0 = No Limit)

Bandwidth (download):  Kbits/sec (0 = No Limit)

### 8.3.1 Simple Mode Settings

**Display:** This section allows you to choose if a "Terms of Use" page will be given to the user connecting to the hotspot.

- **Internal Terms of Use.** Fill in your own terms of use.
- **External Terms of Use.** Specify a URL that has the Terms of Use page. Users will automatically be directed to this page.
- **No Terms of Use. Redirect Only.**

**Redirection on Successful Authentication:** Depending on your choice for the "Terms of Use" page, you have further options for where the user will be directed. After the user accepts the terms, you can either let him/her continue to the URL they were trying to reach or you can force the user to go to a specified URL once before continuing on.

- **To the URL the user intended to visit.**
- **To an administrator-defined URL.**

**Redirect URL:** If you have chosen to send users to an administrator-defined URL, you will need to specify the address.

**Session Timeout:** (Default: 60 minutes.) The amount of time the user may use the router before being forced to authenticate again.

**Idle Timeout:** (Default: 15 minutes.) If the user is idle for this amount of time, make them re-authenticate.

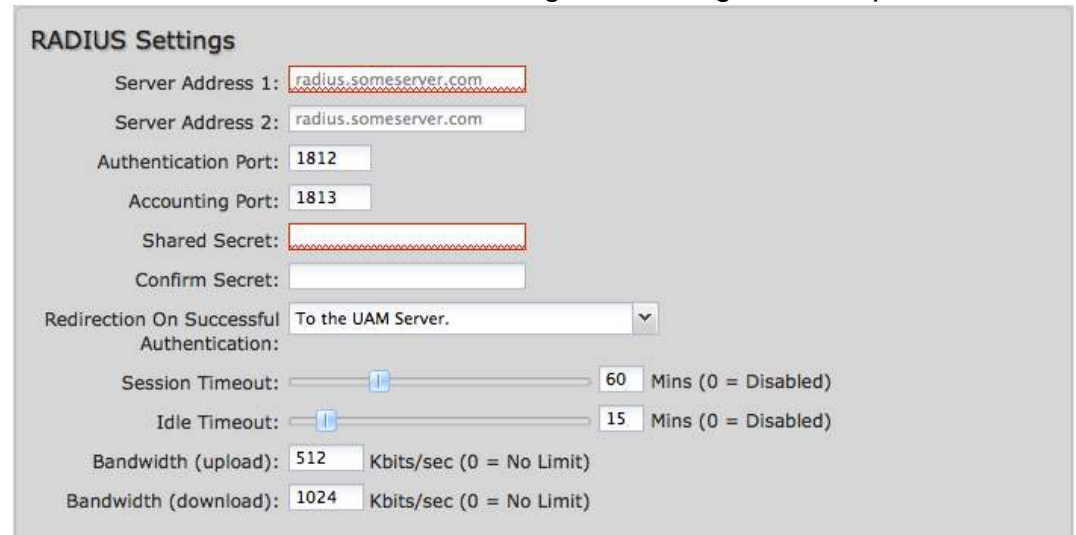

**Bandwidth (upload):** (Default: 512 Kbits/sec.) The data rate limit for users uploading data through the hotspot.

**Bandwidth (download):** (Default: 1024 Kbits/sec.) The data rate limit for users downloading data through the hotspot.

### 8.3.2 RADIUS/UAM Settings

This section allows you to configure a RADIUS and Universal Access Method server. After the user accepts the terms, you can either let him/her continue to the URL they were trying to reach or you can force the user to go to a specified UAM Server or URL once before continuing on.

#### RADIUS settings:

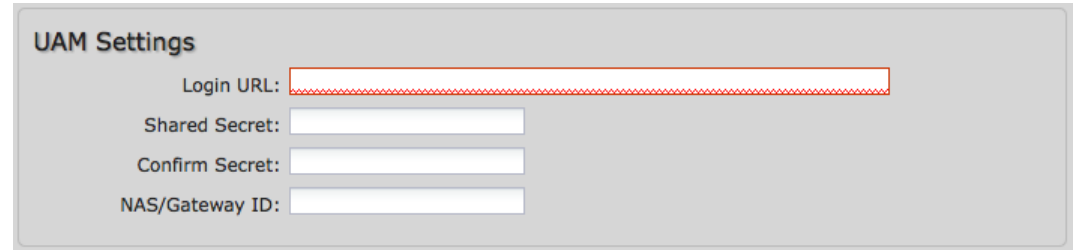

The screenshot shows the RADIUS Settings configuration page. It includes the following fields and options:

- Server Address 1:
- Server Address 2:
- Authentication Port:
- Accounting Port:
- Shared Secret:
- Confirm Secret:
- Redirection On Successful Authentication:
- Session Timeout:  Mins (0 = Disabled)
- Idle Timeout:  Mins (0 = Disabled)
- Bandwidth (upload):  Kbits/sec (0 = No Limit)
- Bandwidth (download):  Kbits/sec (0 = No Limit)

- **Server Address 1:** Assigned by RADIUS service.
- **Server Address 2:** This is an optional backup server.
- **Authentication Port:** The standard port number, 1812, will usually be sufficient.
- **Accounting Port:** The standard port number, 1813, will usually be sufficient.
- **Shared Secret:** Assigned by RADIUS service.
- **Redirection On Successful Authentication:** Choose from the dropdown list of options for redirection:
  - Redirect to the UAM Server.
  - Redirect to the URL that the user intends to visit.
  - Redirect to the following URL (input the desired URL).
- **Session Timeout:** (Default: 60 minutes.) The amount of time the user may use the router before being forced to authenticate again. This value can be overwritten by the RADIUS server.
- **Idle Timeout:** (Default: 15 minutes.) If the user is idle for this amount of time, make them re-authenticate.
- **Bandwidth (upload):** (Default: 512 Kbits/sec.) The data rate limit for users uploading data through the hotspot.
- **Bandwidth (download):** (Default: 1024 Kbits/sec.) The data rate limit for users downloading data through the hotspot.

**UAM Settings:**

- **Login URL:** Assigned by UAM service.
- **Shared Secret:** Optional, depending on the UAM service.
- **NAS/Gateway ID:** Assigned by UAM service.

UAM Settings

Login URL:

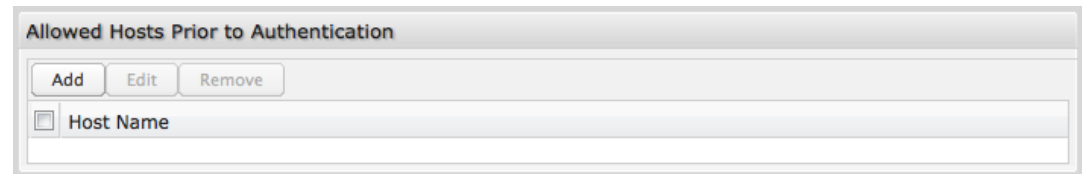

Shared Secret:

Confirm Secret:

NAS/Gateway ID:

8.3.3 Allowed Hosts Prior to Authentication

Adding host names to this list will **allow** access from your network to any external domain or website prior to being authenticated. For example, a hotel might allow access to its own website prior to authentication.

Allowed Hosts Prior to Authentication

Add Edit Remove

Host Name

Click **Add** to enter new hostnames you wish to allow.

Enter the Host or Domain Name of the website you wish to **allow**, i.e. **www.company.com** or **company.com**. To allow all domain and sub-domain options, use a wildcard, i.e. **\*.company.com**.

Add New Host Name

To allow a **host**, add it's **hostname** or **ip address**, i.e. **www.company.com**.

To allow a **domain** or **sub-domain** use a wildcard, i.e. **\*.company.com**.

Host:

Submit

Click **Submit** to save your additions.

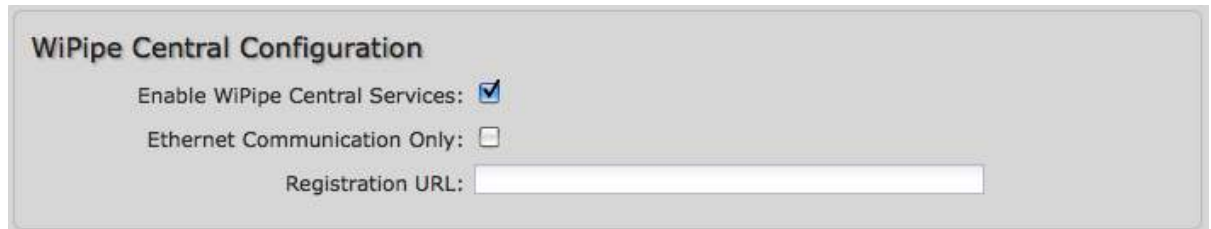

## 8.4 Managed Services ASK YOUR CRADLEPOINT SALES REPRESENTATIVE FOR DETAILS

Managed Services allow you to centralize your router configuration using the WiPipe Central server. WiPipe Central services must be purchased separately.

**Enable Services:** Enables the WiPipe Central client to contact the server.

**Ethernet Communication Only:** Select this to ensure that the WiPipe Central client will not start unless the WAN is Ethernet.

**Registration URL:** Register your router using the code provided by CradlePoint when you purchase WiPipe Central.

**WiPipe Central Configuration**

Enable WiPipe Central Services:

Ethernet Communication Only:

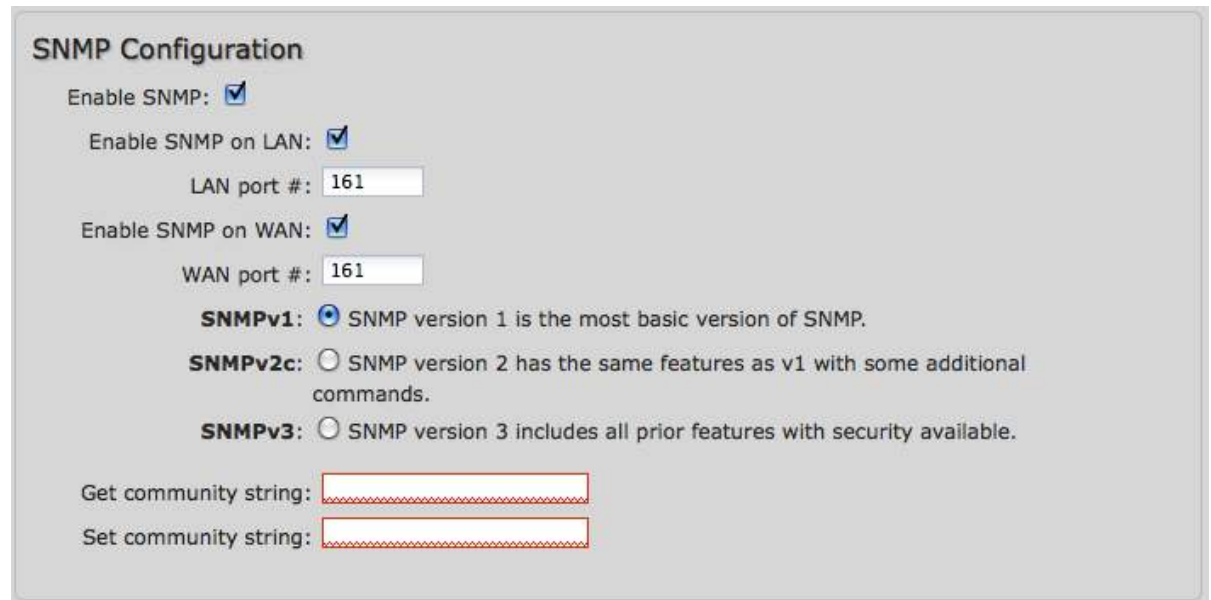

Registration URL:

### 8.4.1 SNMP Configuration

SNMP, or Simple Network Management Protocol, is an Internet standard protocol for remote management. You might use this instead of WiPipe Central if you want to remotely manage a set of routers that include both CradlePoint and non-CradlePoint products.

**Enable SNMP:** Selecting “Enable SNMP” will reveal the router’s SNMP configuration options.

**Enable SNMP on LAN:** Enabling SNMP on LAN will make SNMP services available on the LAN networks provided by this router. SNMP will not be available on guest or virtual networks that do not have administrative access.

**SNMP Configuration**

Enable SNMP:

Enable SNMP on LAN:

LAN port #:

Enable SNMP on WAN:

WAN port #:

**SNMPv1:**  SNMP version 1 is the most basic version of SNMP.

**SNMPv2c:**  SNMP version 2 has the same features as v1 with some additional commands.

**SNMPv3:**  SNMP version 3 includes all prior features with security available.

Get community string:

Set community string:

**LAN port #:** Use the LAN port # field to configure the LAN port number you wish to access SNMP services on. (Default: 161)

**Enable SNMP on WAN:** Enabling SNMP on WAN will make SNMP services available to the WAN interfaces of the router.

**WAN port #:** Use the WAN port # field to configure which publicly accessible port you wish to make SNMP services available on. (Default: 161)

**SNMPv1:** SNMP version 1 is the most basic version of SNMP. SNMPv1 will configure the router to transmit with settings compatible with SNMP version 1 protocols.

**SNMPv2c:** SNMP version 2c has the same features as v1 with some additional commands. SNMPv2c will configure the router to use settings and data formatting compatible with SNMP version 2c.

**SNMPv3:** SNMP version 3 includes all prior features with security available. SNMPv3 is the most secure setting for SNMP. If you wish to configure traps then you must use SNMP version 3.

**Get community string:** The “Get community string” is used to read SNMP information from the router. This string is like a password that is transmitted in regular text with no protection.

**Set community string:** The “Set community string” is used when writing SNMP settings to the router. This string is like a password. It is a good idea to make it different than the “Get community string.”

#### 8.4.2 SNMPv3

If you select SNMPv3, you have several additional configuration options for added security.

**Authentication type:** Select the authentication and encryption type that will be used when connecting to the router from the following dropdown list. These settings must match the configuration used on any SNMP clients.

- MD5 with no encryption
- SHA with no encryption

**SNMPv3:**  SNMP version 3 includes all prior features with security available.

Authentication type:  ▼

Username:

Password:

Verify Password:

Enable SNMP traps:

Trap community string:

Address for trap server:

Trap server port #:

- MD5 with DES encryption
- SHA with DES encryption
- MD5 with AES encryption
- SHA with AES encryption

**Username:** Enter the Username configured on your SNMP host in the username field.

**Password:** Enter the Password for your SNMP host in the password and verify password fields. This password must be at least 8 characters long.

**Enable SNMP traps:** Enabling traps will allow you to configure a destination server, community, and port for trap notifications. Trap notifications are returned to the server with SNMPv1.

**Trap community string:** The trap notifications will be returned to the trap server using this SNMPv1 trap community name.

**Address for trap server:** Enter the address of the host system that you want trap alerts sent to.

**Trap server port #:** Enter the port number that the remote host will be listening for trap alerts on. (Default: 162)

## 8.5 Serial Redirector

Attach a USB serial device to establish a serial link to a host port on the router. The serial console support allows a USB-to-serial connection to another router or similar device. Through a telnet session over the RS232 interface, you can monitor health, pass data, or configure the attached device.

**Enabled:** Select to reveal serial configuration options.

**LAN:** Enable serial redirector for LAN connections.

**Authenticated LAN:** Enable serial redirector for Authenticated LAN connections, you must be logged into the router to use the redirector.

**WAN:** Enable serial redirector for WAN connections.

**Server Port:** Enter a port number for the redirector to use. (Default: 7218)

**Baud Rate:** Select from the dropdown list.

- 50
- 75
- 110
- 134
- 150
- 200
- 300

### Serial Configuration

Server Status: Disabled

Enabled:

LAN:

Authenticated LAN:

WAN:

Server Port:

Baud Rate:  ▼

Byte Size:  ▼

Parity:  ▼

Stop Bits:  ▼

Hardware (RTS/CTS):

Software (XON/XOFF):

Linefeed:  ▼

- 600
- 1200
- 1800
- 2400
- 4800
- 9600
- 19200

**Byte Size:** The number of bits in a byte. Select from: 5, 6, 7, and 8.

**Parity:** Change this value to enable parity bit checking. Select from the following dropdown options:

- None: No parity checking. (Default)
- Even: parity bit will always be even.
- Odd: parity bit will always be odd.
- Mark: parity bit will always be odd and always 1.
- Space: parity bit will always be even and always 0.

**Stop Bits:** Number of bits to initiate the stop period. Select from these dropdown values: 1, 1.5, and 2.

**Hardware (RTS/CTS):** Use RTS (Request To Send)/CTS (Clear To Send) to enable flow control.

**Software (XON/XOFF):** Use XON/XOFF to enable flow control.

**Linefeeds:** Select how you want linefeeds translated (CR = carriage return and LF = line feed).

- Ignore
- CR/LF
- CR
- LF

## 8.6 System Control

**Restore to Factory Defaults:** This changes all settings back to their default values.

**Reboot The Device:** This causes the router to restart.

**Advanced:** System Automatic Reboot and Ping Test

**Scheduled Reboot:** This causes the router to restart at a user-determined time.

**Watchdog Reboot:** This causes the router to automatically restart when it determines an unrecoverable error condition has occurred.

**Ping Test:** A simple test to check Internet connectivity. Type the Hostname or IP address of the computer you want to ping and press 'Enter' or click the 'Ping' button.

The screenshot shows the 'Device Control' interface. At the top, there are two buttons: 'Restore To Factory Defaults' and 'Reboot The Device'. Below this is the 'ADVANCED Advanced Control' section. Under 'System Automatic Reboot', there is a 'Scheduled Reboot' dropdown menu set to 'Never' and an 'Enable Watchdog Reboot' checkbox which is unchecked. There are 'Apply' and 'Undo' buttons. Below that is the 'Ping Test' section, which has an input field for 'Enter Hostname or IP Address' and a 'Ping' button. At the bottom of the screenshot is a 'Ping Results' window showing the output of a ping command to 192.168.0.164. The results show 11 successful pings with varying response times.

```

PING 192.168.0.164 (192.168.0.164)
45 bytes from 192.168.0.164 (192.168.0.164): icmp_seq=0. time=2.195. ms
45 bytes from 192.168.0.164 (192.168.0.164): icmp_seq=1. time=1.944. ms
45 bytes from 192.168.0.164 (192.168.0.164): icmp_seq=2. time=65.588. ms
45 bytes from 192.168.0.164 (192.168.0.164): icmp_seq=3. time=25.737. ms
45 bytes from 192.168.0.164 (192.168.0.164): icmp_seq=4. time=41.910. ms
45 bytes from 192.168.0.164 (192.168.0.164): icmp_seq=5. time=2.270. ms

45 bytes from 192.168.0.164 (192.168.0.164): icmp_seq=10. time=113.750. ms
45 bytes from 192.168.0.164 (192.168.0.164): icmp_seq=11. time=25.313. ms
    
```

## 8.7 System Software

**Firmware Upgrade** allows the administrator to load new firmware onto the router to add new features or fix defects. If you are happy with the operation of the router, you may not want to upgrade just because a new version is available. Check the firmware release notes for information to decide if you should upgrade or not.

**Current Firmware Version:** Shows the number of the current firmware and the date it was updated.

**Available Firmware Version:** If there is a new firmware version available, this will list the version number. Click “Check Again” to have the router check the newest firmware.

**Factory Reset:** Set default settings to match the new firmware. This is safest, as settings may have changed. You should back up your current settings and restore them after the new firmware is loaded.

**Automatically check for new firmware:** Check for an available firmware update once a day.

**Automatic (Internet):** Have the router download the file and perform the upgrade with no user interaction.

**Manual Firmware Upload:** Upload the router firmware from an attached computer.

### 8.7.1 System Config Save/Restore

**Backup Current Settings:** Click on “Save to disk” to save your current settings to a file on a computer.

**Restore Settings:** Click on “Upload from file” to restore your previous settings from a file on a computer.

The screenshot shows a web interface with two main sections. The top section is titled "Firmware Upgrade" and contains the following elements:
 

- Current Firmware Version: v3.4.1 (Fri Dec 09 2011)
- Available Firmware Version: Check
- Factory Reset:
- Automatically check for new firmware:
- Two buttons at the bottom: "Automatic (Internet)" and "Manual Firmware Upload"

 The bottom section is titled "System Config Save/Restore" and contains:
 

- Backup Current Settings:
- Restore Settings:

## 9 GLOSSARY

### 802.11

A family of specifications for wireless local area networks (WLANs) developed by a working group of the Institute of Electrical and Electronics Engineers (IEEE).

### Access Control List

ACL. This is a database of network devices that are allowed to access resources on the network.

### Access Point

AP. Device that allows wireless clients to connect to it and access the network.

### ActiveX

A Microsoft specification for the interaction of software components.

### Ad-hoc network

Peer-to-Peer network between wireless clients.

### Address Resolution Protocol

ARP. Used to map MAC addresses to IP addresses so that conversions can be made in both directions.

### ADSL

Asymmetric Digital Subscriber Line.

### Advanced Encryption Standard

AES. Government encryption standard.

### Alphanumeric

Characters A-Z and 0-9.

### Antenna

Used to transmit and receive RF signals.

### AppleTalk

A set of Local Area Network protocols developed by Apple for their computer systems.

### AppleTalk Address Resolution Protocol

AARP. Used to map the MAC addresses of Apple computers to their AppleTalk network addresses, so that conversions can be made in both directions.

### Application layer

7th Layer of the OSI model. Provides services to applications to ensure that they can communicate properly with other applications on a network.

### ASCII

American Standard Code for Information Interchange. This system of characters is most commonly used for text files.

### Attenuation

The loss in strength of digital and analog signals. The loss is greater when the signal is being transmitted over long distances.

**Authentication**

To provide credentials, like a Password, in order to verify that the person or device is really who they are claiming to be.

**Automatic Private IP Addressing**

APIPA. An IP address that a Windows computer will assign itself when it is configured to obtain an IP address automatically but no DHCP server is available on the network.

**Backward Compatible**

The ability for new devices to communicate and interact with older legacy devices to guarantee interoperability.

**Bandwidth**

The maximum amount of bytes or bits per second that can be transmitted to and from a network device.

**Basic Input/Output System**

BIOS. A program that the processor of a computer uses to startup the system once it is turned on.

**Baud**

Data transmission speed.

**Beacon**

A data frame by which one of the stations in a WiFi network periodically broadcasts network control data to other wireless stations.

**Bit rate**

The amount of bits that pass in given amount of time.

**Bit/sec**

Bits per second.

**BOOTP**

Bootstrap Protocol. Allows for computers to be booted up and given an IP address with no user intervention.

**Bottleneck**

A time during processes when something causes the process to slowdown or stop all together.

**Broadband**

A wide band of frequencies available for transmitting data.

**Broadcast**

Transmitting data in all directions at once.

**Browser**

A program that allows you to access resources on the web and provides them to you graphically.

**Cable modem**

A device that allows you to connect a computer up to a coaxial cable and receive Internet access from your Cable provider.

**CardBus**

A newer version of the PC Card or PCMCIA interface. It supports a 32-bit data path, DMA, and consumes less voltage.

**CAT 5**

Category 5. Used for 10/100 Mbps or 1Gbps Ethernet connections.

**Client**

A program or user that requests data from a server.

**Collision**

When do two devices on the same Ethernet network try and transmit data at the exact same time.

**Cookie**

Information that is stored on the hard drive of your computer that holds your preferences to the site that gave your computer the cookie.

**Data**

Information that has been translated into binary so that it can be processed or moved to another device.

**Data Encryption Standard**

Uses a randomly selected 56-bit key that must be known by both the sender and the receiver when information is exchanged.

**Data-Link layer**

The second layer of the OSI model. Controls the movement of data on the physical link of a network.

**Database**

Organizes information so that it can be managed updated, as well as easily accessed by users or applications.

**DB-25**

A 25-pin male connector for attaching External modems or RS-232 serial devices.

**DB-9**

A 9-pin connector for RS-232 connections

**dBd**

Decibels related to dipole antenna.

**dB<sub>i</sub>**

Decibels relative to isotropic radiator.

**dBm**

Decibels relative to one milliwatt.

**Decrypt**

To unscramble an encrypted message back into plain text.

**Default**

A predetermined value or setting that is used by a program when no user input has been entered for this value or setting.

**Demilitarized zone**

DMZ: A single computer or group of computers that can be accessed by both users on the Internet as well as users on the Local Network, but that is not protected by the same security as the Local Network.

**DHCP**

Dynamic Host Configuration Protocol: Used to automatically assign IP addresses from a predefined pool of addresses to computers or devices that request them.

**Digital certificate**

An electronic method of providing credentials to a server in order to have access to it or a network.

**Direct Sequence Spread Spectrum**

DSSS: Modulation technique used by 802.11b wireless devices.

**DMZ**

“Demilitarized Zone”. A computer that logically sits in a “no-mans-land” between the LAN and the WAN. The DMZ computer trades some of the protection of the router’s security mechanisms for the convenience of being directly addressable from the Internet.

**DNS**

Domain Name System: Translates Domain Names to IP addresses.

**Domain name**

A name that is associated with an IP address.

**Download**

To send a request from one computer to another and have the file transmitted back to the requesting computer.

**DSL**

Digital Subscriber Line. High bandwidth Internet connection over telephone lines.

**Duplex**

Sending and Receiving data transmissions at the same time.

**Dynamic DNS service**

Dynamic DNS is provided by companies to allow users with Dynamic IP addresses to obtain a Domain Name that will always be linked to their changing IP address. The IP address is updated by either client software running on a computer or by a router that supports Dynamic DNS, whenever the IP address changes.

**Dynamic IP address**

IP address that is assigned by a DHCP server and that may change. Cable Internet providers usually use this method to assign IP addresses to their customers.

**EAP**

Extensible Authentication Protocol.

**Email**

Electronic Mail is a computer-stored message that is transmitted over the Internet.

**Encryption**

Converting data into cyphertext so that it cannot be easily read.

**Ethernet**

The most widely used technology for Local Area Networks.

**Fiber optic**

A way of sending data through light impulses over glass or plastic wire or fiber.

**File server**

A computer on a network that stores data so that the other computers on the network can all access it.

**File sharing**

Allowing data from computers on a network to be accessed by other computers on the network with different levels of access rights.

**Firewall**

A device that protects resources of the Local Area Network from unauthorized users outside of the local network.

**Firmware**

Programming that is inserted into a hardware device that tells it how to function.

**Fragmentation**

Breaking up data into smaller pieces to make it easier to store.

**FTP**

File Transfer Protocol. Easiest way to transfer files between computers on the Internet.

**Full-duplex**

Sending and Receiving data at the same time.

**Gain**

The amount an amplifier boosts the wireless signal.

**Gateway**

A device that connects your network to another, like the Internet.

**Gbps**

Gigabits per second.

**Gigabit Ethernet**

Transmission technology that provides a data rate of 1 billion bits per second.

**GUI**

Graphical user interface.

**H.323**

A standard that provides consistency of voice and video transmissions and compatibility for video conferencing devices.

**Half-duplex**

Data cannot be transmitted and received at the same time.

**Hashing**

Transforming a string of characters into a shorter string with a predefined length.

**Hexadecimal**

Characters 0-9 and A-F.

**Hop**

The action of data packets being transmitted from one router to another.

**Host**

Computer on a network.

**HTTP**

Hypertext Transfer Protocol is used to transfer files from HTTP servers (web servers) to HTTP clients (web browsers).

**HTTPS**

HTTP over SSL is used to encrypt and decrypt HTTP transmissions.

**Hub**

A networking device that connects multiple devices together.

**ICMP**

Internet Control Message Protocol.

**IEEE**

Institute of Electrical and Electronics Engineers.

**IGMP**

Internet Group Management Protocol is used to make sure that computers can report their multicast group membership to adjacent routers.

**IIS**

Internet Information Server is a WEB server and FTP server provided by Microsoft.

**IKE**

Internet Key Exchange is used to ensure security for VPN connections.

**Infrastructure**

In terms of a wireless network, this is when wireless clients use an access point to gain access to the network.

**Internet**

A system of worldwide networks that use TCP/IP to allow for resources to be accessed from computers around the world.

**Internet Explorer**

A World Wide Web browser created and provided by Microsoft.

**Internet Protocol**

The method of transferring data from one computer to another on the Internet.

**Internet Protocol Security**

IPsec provides security at the packet processing layer of network communication.

**Internet Service Provider**

An ISP provides access to the Internet to individuals or companies.

**Intranet**

A private network.

**Intrusion Detection**

A type of security that scans a network to detect attacks coming from inside and outside of the network.

**IP**

Internet Protocol.

**IP address**

A 32-bit number, when talking about Internet Protocol Version 4, that identifies each computer that transmits data on the Internet or on an intranet.

**IPsec**

Internet Protocol Security.

**IPX**

Internetwork Packet Exchange is a networking protocol developed by Novell to enable their Netware clients and servers to communicate.

**ISP**

Internet Service Provider.

**Java**

A programming language used to create programs and applets for web pages.

**Kbps**

Kilobits per second.

**Kbyte**

Kilobyte.

**L2TP**

Layer 2 Tunneling Protocol.

**LAN**

Local Area Network.

**Latency**

The amount of time that it takes a packet to get from the one point to another on a network. Also referred to as delay.

**LED**

Light Emitting Diode.

**Legacy**

Older devices or technology.

**Local Area Network**

LAN. A group of computers in a building that usually access files from a server.

**LPR/LPD**

“Line Printer Requestor”/“Line Printer Daemon”. A TCP/IP protocol for transmitting streams of printer data.

**MAC Address**

A unique hardware ID assigned to every Ethernet adapter by the manufacturer.

**Mbps**

Megabits per second.

**MDI**

Medium Dependent Interface is an Ethernet port for a connection to a straight-through cable.

**MDIX**

Medium Dependent Interface Crossover is an Ethernet port for a connection to a crossover cable.

**MIB**

Management Information Base is a set of objects that can be managed by using SNMP.

**Modem**

A device that modulates digital signals from a computer to an analog signal in order to transmit the signal over phone lines. It also demodulates the analog signals coming from the phone lines to digital signals for your computer.

**MPPE**

Microsoft Point-to-Point Encryption is used to secure data transmissions over PPTP connections.

**MTU**

Maximum Transmission Unit is the largest packet that can be transmitted on a packet-based network like the Internet.

**Multicast**

Sending data from one device to many devices on a network.

**NAT**

Network Address Translation allows many private IP addresses to connect to the Internet, or another network, through one IP address.

**NetBEUI**

NetBIOS Extended User Interface is a Local Area Network communication protocol. This is an updated version of NetBIOS.

**NetBIOS**

Network Basic Input/Output System.

**Netmask**

Determines what portion of an IP address designates the Network and which part designates the Host.

**Network Interface Card**

NIC. A card installed in a computer or built onto the motherboard that allows the computer to connect to a network.

**Network Layer**

The third layer of the OSI model which handles the routing of traffic on a network.

**Network Time Protocol**

Used to synchronize the time of all the computers in a network.

**NIC**

Network Interface Card.

**NTP**

Network Time Protocol.

**OFDM**

Orthogonal Frequency-Division Multiplexing is the modulation technique for both 802.11a and 802.11g.

**OSI**

Open Systems Interconnection is the reference model for how data should travel between two devices on a network.

**OSPF**

Open Shortest Path First is a routing protocol that is used more than RIP in larger scale networks because only changes to the routing table are sent to all the other

routers in the network as opposed to sending the entire routing table at a regular interval, which is how RIP functions.

**Password**

A sequence of characters that is used to authenticate requests to resources on a network.

**Personal Area Network**

The interconnection of networking devices within a range of 10 meters.

**Physical layer**

The first layer of the OSI model. Provides the hardware means of transmitting electrical signals on a data carrier.

**Ping**

A utility program that verifies that a given Internet address exists and can receive messages. The utility sends a control packet to the given address and waits for a response.

**PoE**

Power over Ethernet is the means of transmitting electricity over the unused pairs in a category 5 Ethernet cable.

**POP3**

Post Office Protocol 3 is used for receiving email.

**Port**

A logical channel endpoint in a network. A computer might have only one physical channel (its Ethernet

channel) but can have multiple ports (logical channels) each identified by a number.

### **PPP**

Point-to-Point Protocol is used for two computers to communicate with each over a serial interface, like a phone line.

### **PPPoE**

Point-to-Point Protocol over Ethernet is used to connect multiple computers to a remote server over Ethernet.

### **PPTP**

Point-to-Point Tunneling Protocol is used for creating VPN tunnels over the Internet between two networks.

### **Preamble**

Used to synchronize communication timing between devices on a network.

### **QoS**

Quality of Service.

### **RADIUS**

Remote Authentication Dial-In User Service allows for remote users to dial into a central server and be authenticated in order to access resources on a network.

### **Reboot**

To restart a computer and reload its operating software or firmware from nonvolatile storage.

### **Rendezvous**

Apple's version of UPnP, which allows for devices on a network to discover each other and be connected without the need to configure any settings.

### **Repeater**

Retransmits the signal of an access point in order to extend its coverage.

### **RIP**

Routing Information Protocol is used to synchronize the routing table of all the routers on a network.

### **RJ-11**

The most commonly used connection method for telephones.

### **RJ-45**

The most commonly used connection method for Ethernet.

### **RS-232C**

The interface for serial communication between computers and other related devices.

### **RSA**

Algorithm used for encryption and authentication.

### **Server**

A computer on a network that provides services and resources to other computers on the network.

**Session key**

An encryption and decryption key that is generated for every communication session between two computers.

**Session layer**

The fifth layer of the OSI model which coordinates the connection and communication between applications on both ends.

**Simple Mail Transfer Protocol**

Used for sending and receiving email.

**Simple Network Management Protocol**

Governs the management and monitoring of network devices.

**SIP**

Session Initiation Protocol. A standard protocol for initiating a user session that involves multimedia content, such as voice or chat.

**SMTP**

Simple Mail Transfer Protocol.

**SNMP**

Simple Network Management Protocol.

**SOHO**

Small Office/Home Office.

**SPI**

Stateful Packet Inspection.

**SSH**

Secure Shell is a command line interface that allows for secure connections to remote computers.

**SSID**

Service Set Identifier is a name for a wireless network.

**Stateful Packet Inspection**

A feature of a firewall that monitors outgoing and incoming traffic to make sure that only valid responses to outgoing requests are allowed to pass through the firewall.

**Subnet mask**

Determines what portion of an IP address designates the Network and which part designates the Host.

**Syslog**

System Logger -- a distributed logging interface for collecting in one place the logs from different sources. Originally written for UNIX, it is now available for other operating systems, including Windows.

**TCP**

Transmission Control Protocol.

**TCP Raw**

A TCP/IP protocol for transmitting streams of printer data.

**TCP/IP**

Transmission Control Protocol/Internet Protocol.

**TFTP**

Trivial File Transfer Protocol is a utility used for transferring files that is simpler to use than FTP but with less features.

**Throughput**

The amount of data that can be transferred in a given time period.

**Traceroute**

A utility displays the routes between your computer and specific destination.

**UDP**

User Datagram Protocol.

**Unicast**

Communication between a single sender and receiver.

**Universal Plug and Play**

UPnP. A standard that allows network devices to discover each other and configure themselves to be a part of the network.

**Update**

To install a more recent version of a software or firmware product.

**Upgrade**

To install a more recent version of a software or firmware product.

**Upload**

To send a request from one computer to another and have a file transmitted from the requesting computer to the other.

**UPnP**

Universal Plug and Play.

**URL**

Uniform Resource Locator is a unique address for files accessible on the Internet.

**USB**

Universal Serial Bus.

**UTP**

Unshielded Twisted Pair.

**Virtual Private Network**

VPN: A secure tunnel over the Internet to connect remote offices or users to their company's network.

**VLAN**

Virtual LAN.

**Voice over IP**

Sending voice information over the Internet as opposed to the PSTN

**VoIP**

Voice over IP.

**Wake on LAN**

Allows you to power up a computer through it's Network Interface Card.

**WAN**

Wide Area Network.

**WCN**

Windows Connect Now. A Microsoft method for configuring and bootstrapping wireless networking hardware (access points) and wireless clients, including PCs and other devices.

**WDS**

Wireless Distribution System. A system that enables the interconnection of access points wirelessly.

**Web browser**

A utility that allows you to view content and interact with all of the information on the World Wide Web.

**WEP**

Wired Equivalent Privacy is security for wireless networks that is supposed to be comparable to that of a wired network.

**WiFi**

Wireless Fidelity. Used to describe any of the 802.11 wireless networking specifications.

**WiFi Protected Access**

An updated version of security for wireless networks that provides authentication as well as encryption.

**Wide Area Network**

The larger network that your LAN is connected to, which may be the Internet itself, or a regional or corporate network.

**Wireless (WiFi) LAN**

Connecting to a Local Area Network over one of the 802.11 wireless standards.

**Wireless ISP**

WISP. A company that provides a broadband Internet connection over a wireless connection.

**WISP**

Wireless Internet Service Provider.

**WLAN**

Wireless Local Area Network.

**WPA**

WiFi Protected Access. A WiFi security enhancement that provides improved data encryption, relative to WEP.

**xDSL**

A generic term for the family of digital subscriber line (DSL) technologies, such as ADSL, HDSL, RADSL, and SDSL.

## **Yagi antenna**

A directional antenna used to concentrate wireless signals on a specific location.

## 10 APPENDIX

### 10.1 Regulatory Information

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. This device must accept any interference received, including interference that may cause undesired operation. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try and correct the interference by one or more

of the following measures:

- *Reorient or relocate the receiving antenna.*
- *Increase the separation between the equipment and receiver.*
- *Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.*
- *Consult the dealer or an experienced radio or television technician for help.*

Changes or modifications not expressly approved by CradlePoint, Inc. could void the user's authority to operate the product.

#### Radio Frequency Interference Requirement - Canada

This Class B digital apparatus complies with Canadian ICES-003.

Cet appareil numérique de la classe B est conforme à la norme NMB-003 du Canada.

### 10.2 Warranty Information

CradlePoint, Inc. warrants this product against defects in materials and workmanship to the original purchaser (or the first purchaser in the case of resale by an authorized distributor) for a period of one (1) year from the date of shipment. This warranty is limited to a repair or replacement of the product, at CradlePoint's discretion.

Within thirty (30) days of receipt should the product fail for any reason other than damage due to customer negligence, purchaser may return the product to the point of purchase for a full refund of the purchase price.

If the purchaser wishes to upgrade or convert to another CradlePoint, Inc. product within the thirty (30) day period, purchaser may return the product and apply the full purchase price toward the purchase of the other product. Any other return will be subject to CradlePoint, Inc.'s existing return policy.

IN NO EVENT SHALL CRADLEPOINT'S LIABILITY EXCEED THE PRICE PAID FOR THE PRODUCT FROM DIRECT, INDIRECT, INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES RESULTING FROM THE USE OF THE PRODUCT, ITS USER INTERFACE SOFTWARE, OR ITS DOCUMENTATION.

CradlePoint makes no warranty or representation, expressed, implied, or statutory, with respect to its products or the contents or use of this documentation and all user interface software, and specifically disclaims its quality, performance, merchantability, or fitness for any particular purpose. CradlePoint reserves the right to revise or update its products, software, or documentation without obligation to notify any individual or entity.

## 10.3 Specifications

### MODEL NAME

CBR400 Compact Broadband Router

### WAN / INTERNET

3G/4G via two modem ports (1 USB 2.0, 1 ExpressCard); one 10/100 Ethernet port (default LAN)

### LAN

WiFi 802.11 b/g/n, one 10/100 Ethernet port (default)

### BUTTONS / SWITCHES

Modem Signal Strength, ExpressCard lock, Reset, and Power

### LED INDICATORS

Power, Ethernet, WiFi, USB Status, ExpressCard Status, Modem Signal Strength

### DIMENSIONS

2.8" x 4.8" x 0.8" (72mm x 122mm x 19mm)

### CERTIFICATIONS

FCC, IC, CE, WiFi Alliance, RoHS

### OPERATING TEMPERATURE

0°C to 40°C

### DETAILS

- 2.412 to 2.484 GHz WiFi Frequency Band Operation
- Compliant with IEEE 802.3 and 3u Standards
- Supports OFDM and CCK Modulation
- Supports Cable/DSL modems with Dynamic IP, Static IP, PPPoE, PPTP, or L2TP Connection Types
- Traffic Control, Port Forwarding, Virtual Server (max 32 servers) and DMZ
- Compatible with HSPA, EVDO, LTE, & WiMAX Cellular Network Devices
- Easy Management via HTTP and Remote Management via HTTP and SNMP
- Create, Manage, and Terminate IPsec VPN Sessions
- Supported VPN Implementations: CradlePoint to CradlePoint, CradlePoint to Cisco/Linksys Routers, and CradlePoint to Linux Systems<sup>1</sup>
- Tunnel (default) and Transfer<sup>1</sup> (a.k.a. Transport) Modes
- Hash Algorithms (hardware accelerated) - MD5, SHA128, SHA256, SHA384, SHA512
- Cipher Algorithms (hardware accelerated) - AES, 3DES, DES
- Keying - automatic using IKE 1.0 or manual
- Authentication Method: Pre-Shared Key

---

<sup>1</sup> Transfer Mode to be released with Firmware Version 3.3
